Topic: 8740 Message: 8740

hi everybody,
I'm new in your Yahoo group.
my question :

i can buy a TS-850SAT

the serial number is 30900645

i risk an DDS issue ?
or
Other ?

Sorry for my poor english.
Laurent F0GEV

8741. TS-850 Tx Off Frequency

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-05 22:12:42 UTC
From: ve3dpt
Topic: 8741 Message: 8741

My radio has suddenly developed a problem. The Tx frequency is approx 1.5 Khz low. I tried various bands and modes and the problem is fairly consistent. After reading several previous posts I have done several checks that were suggested. It appears that the problem may be with LO3 (8.375 MHz). It is ok in RX according to my Freq Counter, but shifts higher in Tx mode (about the amount of the error). Has anyone encountered this before, or have a suggestion?

8742. ts 450 damaged in shipping, need parts

my if/rf switch as well as my notch/squelch sqitch (dual concentric potentiometer) were damaged recently when i had it shipped over the holidays. i tried to repair but the posts were completely torn apart. i am unable to find any replacement parts as they as all discontinued. does anybody know where i can find replacement parts or know the power rating for each switch? i know the resistance, with the power rating i could mod it with just single switchs from mouser.com. any help would be greatly appreciated. and on a side note, dont let the fedex store pack your rig without getting insurance.

Try seller HIFISSB on EBay, he is always breaking rigs, I got a complete IF board from him as spare for mine.

I had this problem with a TS-870D, it was a bad connection on one of the plugs to the synthesiser section, I think there was a loss of 8V or similar on Transmit. Sorry to be vague but it was some time ago !

According to my notes it should not change frequency in going from rx to tx in cw mode.

The DDS chips are 2 sections, one for rx and the other for tx. Check pin 63, it is the A/B section selection pin.

8750. Odd IF filter behaviour in TS-850S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-06 21:29:41 UTC
From: nx7u
Topic: 8750 Message: 8750

I have added two files to the "FILES" section (under NX7U Filter Measurements), showing the measured passbands of the various IF filter selections in my TS-850. Each file is a set of 6 spectrum shots, one set in CW mode and the other set in SSB mode. Each spectrum shot shows the IF filter selection in "order" (e.g., 8.83-455). Note that for CW I have the Pitch set to 500 Hz.
In the 8.83 MHz IF, filter position #1 is the YK-88SN-1 and filter position #2 is the YK-88C-1, so if I understand the annunciation scheme correctly "500" means filter position #1 (or 1.8 kHz SSB filter) and "270" means filter position #2 (or 500 Hz CW filter).
So...
These plots are crazy whacked!
> 8.83IF CW filter center frequency doesn't match 455IF CW filter center frequency in USB mode
> 8.83IF SSB filter has significant in-band insertion loss above 1 kHz
> 3 different filter selections in CW mode all look nearly identical

Can anyone help identify what might be wrong here? I have a feeling there are two things wrong here but I am having a hard time separating them out.

Topic: 8750 Message: 8751

Hi
Your plots seem to show a lot of variation in insertion loss between the various filters, and most definitely shows why same-bandwidth filters in each IF are a good thing, just look at the ssb bw superimposed onto the cw bw plot. The discrepancies in insertion loss may just be something one has to live with for the 850, and analog IF Kenwoods in general, but then again perhaps you have bad filters?

n0sya

NX7U,

Regarding the "> 8.83IF CW filter center frequency doesn't match 455IF CW filter center frequency in USB mode" part of your post:

I believe that this is as it should be... The ssb filters for the 2nd IF (8830) have a center frequency of 8830.0 KHz, while the CW filters (YK-88C-1 and YK-88CN-1) have a center frequency of 8830.7 KHz (due to the offset required for CW reception).

As background info, I had a TS-440 that I put a YK-88C-1 into (after removing it from the plug-in board). The TS-440 should have had a YK-88C, but I got a good deal on a YK-88C-1 and thought it was worth a try. It worked, but I had to set the IF-Shift almost all the way CCW to get "normal" sounding audio... Then I checked the InRad website and found that the correct CW filter for the 440 had a CF=8830.0, while the CW filter for a 450 (which is supposed to have a YK-88C-1) had CF=8830.7. I concluded that the 440 and the 450 implemented the CW shift in different stages (maybe the 1st IF for the 440). The CF for all of the SSB filters for both the 440 and the 450 were all 8830.0.

So, my main purpose for this post is to ask Cliff if he would mind offering a an explanation of how the various Kenwood models deal with the 700-800 Hz shift for CW reception... And also, Cliff, could you comment on the issue of using 500 Hz CW filters in both the 2nd and 3rd IF of models like the 450 and 850? For instance, with both enabled, will the IF-Shift control provide some degree of Variable Bandwidth control? (I have a 450 that I'm considering adding a 2nd CW filter to.) I'm sure other readers would be interested in reading Cliff's explanations as well...

Thanks, HNY, Cheers, & 73...
Chuck WA3CEJ

The YK88C and CN have a center freq of 8830.7. The -1 filters have a center freq of 8830.0 That's why they don't interchange well. The YG455C and CN have the same thing, center of 455.7 and the -1's have 455.0.

The Narrow SSB is the same for both.

Clif

The AF spectra were screenshots saved from Spectrum Lab (DL4YHF).
Rig terminated in dummy load, ALC off, AF gain adjusted just prior to AF clipping into my laptop (an attempt to maximize dynamic range...but even with bandlimited noise that's not easy to do)

My filters are all -1. So it sounds like I shouldn't have any offset issues (?).

One other thing that is troubling, is that while the 455 CW filter looks just like you'd think it should look, the 8.83 CW filter (also 500 Hz) hardly looks as if it rejects anything. Not nearly as "filter-like" as the 455 filter. I understand that if all the selectivity is in an earlier IF, that some noise accumulation could happen in the stopband in later IFs...but on the order of 60 dB?? (since the filter ultimate attenuation is supposedly 80 dB and the delta measured is 10-20dB).

As Cliff pointed out, I had it backwards and the "-1" filters don't have that 700 Hz offset on the CW filters, so it would appear that what I said earlier would not apply here...

Sorry for the confusion!

And thanks, Cliff, for setting me straight.

Subject: [TS-850_450_690] Re: Odd IF filter behaviour in TS-850S

My filters are all -1. So it sounds like I shouldn't have any offset issues (?).

One other thing that is troubling, is that while the 455 CW filter looks just like you'd think it should look, the 8.83 CW filter (also 500 Hz) hardly looks as if it rejects anything. Not nearly as "filter-like" as the 455 filter. I understand that if all the selectivity is in an earlier IF, that some noise accumulation could happen in the stopband in later IFs...but on the order of 60 dB?? (since the filter ultimate attenuation is supposedly 80 dB and the delta measured is 10-20dB).

When I first got my TS-850, I noticed that with the CW filter on (500 Hz wide 8.83 MHz filter, YK88-C-1 I believe) the slope tuning controls did not behave as on other TS-850's I've used. I do not have a 455 kHz 500 Hz filter in the rig.

On other TS-850's, the inner and outer slope tuning knobs would seem to tune through a null of some sort maybe 200 degrees from their normal position - e.g. the outer "low cut" knob, when turned about 200 degrees CCW from the fully CW position, would pass this null. With my radio, I only need to turn this knob about 30 degrees CCW to find this null. I can't get the full benefits of the slope tuning I've been able to get on other TS-850's. Likewise for the high cut knob, turning it CW from the fully CCW position.

I don't notice this problem with the 1.8 kHz SSB filter I have in the rig.

Is there some internal adjustment that can be made to correct this? Or is my CW filter defective?

73, Zack W9SZ

I have a Cat cable and homebrew audio cables already hooked up.

EasyPal has the commands for Icom and Yaesu but not for Kenwood. You select the port, in my case Comm 1, but then you have to setup the port and part of the settings is the Command Strings for PTT On and PTT Off. It is the command strings I need so EasyPal will key the Kenwood TS-850s.

I just thought maybe someone knows what the command strings are and could send them to me.

I do not like VOX operation so that is why I am using the Cat Cable.

If you have the schematics (or if you know where the 8.83 MHz filters sit), you could simply tap into the inputs of the filter. You would probably want to buffer the tap with an FET amp or an FET transistor so that it doesn't load down the RF chain.

I tried tapping the 8.83MHz for the SM-220 on both a TS-450 and an R-4000 using just the tip of the RCA plug that plugs into the SM220 (just as an experiment, I already have a TS-830 and 850). It worked fine with the exeption of reducing the signal a bit. That's why I recommend the buffer.

Aloha Rupert,
Replace C18 on the display board and check for any bad traces that the old cap might have eaten up.
Roland AH6RR
Been there, Done that and even got the Tee shirt.

what version of easypal, and maybe you should be asking the software testers. check out kb4yz website, several links to easypal from there and kc1cs...

It sounds more like a software setting problem than 850 problem

also will depend on what version you are trying to set up. If I can help furthur, email off group.. ve3wej@...

Subject: Re: [TS-850_450_690] EasyPal

I have a Cat cable and homebrew audio cables already hooked up.

EasyPal has the commands for Icom and Yaesu but not for Kenwood. You select the port, in my case Comm 1, but then you have to setup the port and part of the settings is the Command Strings for PTT On and PTT Off. It is the command strings I need so EasyPal will key the Kenwood TS-850s.

I just thought maybe someone knows what the command strings are and could send them to me.

I do not like VOX operation so that is why I am using the Cat Cable.

Hi John,

I did a similar modification for my TS120S, and later, TS130S) rigs. The TS450S is a triple-conversion design. For the Panadapter to work, you neeed to connect it ahead of any significant selectivity. This would be ahead of the 2nd IF filter (8.83 MHz). Any Roofing Filter in the 1st IF (73.05 MHz) will limit the bandwidth you'll see out of the 2nd IF.

The 450 manual shows no IF output but there are unused pins on the ACC2 connector (pins 1, 6, and 7). You would pick up the output of the 2nd Mixer (Q26, Q27) on the RF Unit (X44-3130-00). The secondary of the 2nd Mixer output transformer (L72) looks like a good point, as it appear to be a low impedance point.

You'll want to do two things:
1) provide adequate signal level & provide a Lo-Z source to the Panadapter
2) minimize loading of the IF signal.

I did this in my rigs by building a simple buffer amplifier. I used a 2N2222/2N3904 NPN transistor in a common-emitter circuit, mounted "dead bug style" on a scrap of PCB inside the rig near the mixer output. A 2N5179 is a better transistor but I had lotsa 2N3904s on hand. It has about 10dB gain. The circuit is here: http://tinyurl.com/bcp2e4 if you want to clone it. I used miniature coax cable (RG-174/U) to pass the signal thru one of the unused pins on the Accessory connector.

vy 73,
Bryan WA7PRC

8786. More: Odd IF Filter Behaviour in TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-12 15:56:54 UTC
From: nx7u
Topic: 8786 Message: 8786

First, an apology as I made a mistake in the spectrograms I uploaded earlier. The CW passbands have been updated...the 1k8-2k7 and 2k7-500 cases were wrong. Somehow I got mixed up in cut-and-paste!

Now it looks to me that the 8.83/2.7k filter isn't being completely switched out of the IF signal path when an optional filter is selected.

I ran the following test: I removed the optional filters, but didn't change S501. I verified that the rig "thought" the filters were still there by checking the switching voltage on the optional filter header pins. When the (non-existent) optional filter was selected, there was still a significant passband of noise present, about 10 dB down. In fact, it looks a *lot* like the part of the AF passband that is still present in the 500_2k7 spectrograms, outside the 500 Hz nominal filter bandwidth...in other words, the part that made me think there was a problem to begin with.

I'm not entirely sure if this is a definitive test, as some AF power would be generated with no IF present (open circuit in 8.83 IF, like I was trying to create). But I kinda doubt it would be that much AF power. With only 10 dB added insertion loss, I'd be able to RX on the low bands with no problem (and TX if I opted to bypass IF filters on TX). I'd be oblivious to the absence of a signal path.

Can anyone duplicate this result?

8787. A Question: On 8.83 MHz IF filters in TS-850S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-12 16:21:16 UTC
From: nx7u
Topic: 8787 Message: 8787

Something I noticed when poking around with my 8.83 MHz IF filter problem:

"Optional Filter 1" position, which is silkscreened on my RF Unit PCB as "CN-1" and annotated in my Service Manual schematic as "YK88CN1", has a 22 pF shunt cap on the RX input side of the filter. I verified that the "270" annunciator on the front panel corresponds to this position.

"Optional Filter 2" has no shunt caps. My RF Unit PCB is silkscreened "CN" and the schematic annotated "YK88C1". I verified that the "500" annunciator on the front panel corresponds to this position.

The Service Manual makes no mention of an SSB filter (pg. 12, "IF filter selection").

The Operating Manual (under Filter Installation) shows to put CN-1 in the CN-1 spot, and C-1 in the C-1 spot (so far, so good). But I'm curious as to how the SN-1 filter can go in either spot...especially with that additional 22 pF shunt cap in the CN-1 position.

I haven't swapped my filter positions to check, since I'm not sure my filter switching is working correctly right now.

Can anyone shed some light on this?

It would seem (from the Service Manual, at least) that the design intent of the 8.83 IF was two CW filters. Maybe the "Slope Tune" was really meant to make up for this by allowing you to narrow the passband selectively in the 2.7k-2.7k filter lineup.

While goofing off instead of working I downloaded the software you are using. It seems very good albeit complicated for my simple mind.

Several things I noted.

The filters don't give a true picture of what they are doing when compared against the noise floor. A swept signal into the radio gives much truer picture. I'm trying to refine the setup to give decent images. The pictures you show have a 30dB range on the filtering while with a swept source it is over 60dB.

I'll post a picture for grins showing a -121dBm signal poking out of the top of the filter traces set at 2.7 both sides. The signal peak is about 32 dB above the noise. Another image shows a -137dBm signal same setup which as you would expect is ~16dB above the filter noise floor.

Don't look like I'll get much done today due to playing.

Clif

One thing I did notice is that you can save and export your setup. Which means we could all be using the same setup to compare notes. That would be very helpful.

What I'm looking at is I have access to all of the Kenwood HF rigs (at one time or another) and can do a comparison. That could be fun. The variable could be in the quality of the sound cards used by each. Now if you could standardize that!!!!

If either finds a setup you like share it.

8797. Strange RX problem - deaf with some filters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-12 21:05:43 UTC
From: Alexandr Kobranov
Topic: 8797 Message: 8797

Friends,
just a day before installation of INRAD roofing filter u/g to my old TS-850 (yes, I want to keep this radio :-)) I discovered that after switchin on the RX is totally deaf.
After some tests it was recognized that this problem is related to filter selection.
I have complete set with all optional filters (8.83 - 400 and 270Hz, 455 - 500Hz).
When I select any 500 or 400 or 270Hz filter, the audio gone and RX is deaf completely (not only attenuated but really deaf). Just after selecting let say 2.7 - 2.7 combination it is alive. And all wider filters the same - RX is OK.
As this is related to both channels (8.83 and 455) I do not believe it is something about diodes or swithing voltages.
This is band-independent, tested on several bands. CW/SSB also the same.

Can be some problem with CAR unit? PLL loop problem?
What to check at first?
Any experience anywhere?

Sorry if this was dicussed before, not able to find now, email me direcly in such case with some referrence.
Hope to resolve this :-(

Thanks for any advice,

73!
Lexa, ok1dst

Lexa if you followed the installation papers that came with the filter that could be the problem they have the jumpers in the wrong connections try to swtich the small coax jumpers. I had the same problem when I did mine many months ago. The install directions on thier website is correct but the papers they send out is wrong.
Hope this helps.

Hi Roland,

maybe it was not clear from my message but all this works for a long
time ok. Last Stew Perry Contest on Top band I spent wit 270Hz filter
mostly.
One additional experience - during fast cycling of filters there is
some signal on narrow setting but only for a second or so then
dissapear. Simply there is some problem which was not before for sure.
Mechanical checking of filters already done - all seems to be ok, no
visible changes, radio was sitting for one year on the same place...
Hope somebody can put some other idea..

Thanks anyway!

Ok look at it logically.

The radio is working perfect.
An additional filter is installed and it doesn't work.

Try uninstalling the new filter and see what happens. You probably have a solder blob on the circuit board you missed or a fine piece of wire that is shorting something.

The problem has to do with the new filter installation.

Clif

8802. Round 3: 8.83 MHz IF filters in TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)

From: nx7u
Topic: 8802 Message: 8802

Clif (and the rest),
You were correct, having an RF signal sweep across the RX passband (rather than relying only on noise output) is the way to go. I should have known that...it's basically a system noise figure problem...the soundcard needs to be "externally noise limited" and it wasn't.

I have updated my filter screenshots to the Files section. And I have included the .ini settings file exported from Spectrum Lab so that others can duplicate my analyzer setup.

As to the new measurement: what I did was set Spectrum Lab to record "peak holding graph", which is on the very first options tab "Spectrum (1)". I set the holding time to 300 seconds. Then, for a "swept" RF source, I used an IFR1500 Service Monitor. The RF carrier frequency is PLL-controlled and the smallest step is 100 Hz, which is too big for "dragging" a CW signal across the passband, even at peak-hold. So I set the IFR in AM mode, 100% modulation, and set the carrier below the display frequency of the TS-850. Then I just varied the modulating tone frequency in AM mode. I could change the mod tone in 1 Hz increments, but used 10 Hz and digitally swept the sideband about 30 Hz/second while running Spectrum Lab in peak-hold. That way I got a fairly easy to distinguish passband shape.

Now the graphs have 60 dB dynamic range. Also you can see there are no *major* problems, like I originally feared. But there are still some oddities.
1) the center frequency of the 500 Hz filters together in USB are not the same...they're off by about 250 Hz. So the resultant 500-500 bandwidth is quite narrow. This would make PSK31 a bit interesting.
2) the passband of the YK-88SN-1 is a bit strange (to me). It looks too narrow in CW mode (quite a bit narrower than 1.8 kHz) and displaced too high in SSB mode...cutting off too much bass response and leaving too much treble.

Next I think I'll try swapping the filter positions and see what that does, just for fun. Since there's that extra 22 pF cap on one position.

8804. Re: [TS-850_450_690] Re: Strange RX problem - deaf with some filters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-13 08:59:13 UTC
From: Alexandr Kobranov
Topic: 8797 Message: 8804

Hi Clif,

maybe I have two problems now - the first is a deaf radio with narrow filters and second one with exact explanation of my situation :-)

So let´s recapitulate:

1) TS-850 is in the same configuaration as a year(-s) before when run perfectly.

2) Last QSO some days before on 3.5 or 10MHz, then switched off

3) After switching on - no signal, deaf with any narrow filter.

4) With any wider combination (2,7 - 2,7 etc.) there is normal audio out corresponding to band conditions, antenna OK, TX OK (power and SWR)

5) When cycling filters there is short signal output in narrow mode but only for second or less, then deaf completely.

6) This is band and mode (CW/SSB) independent

7) Just after this experience unit was opened and all around filters was mechanically checked - no problem discovered

So no filters added, no configuration changes, only swithing on previously running machine... and deaf with narrow filters.

Yes, there is intention to add INRAD roofing filter mod but NOT PERFORMED yet.

Maybe I missed something and being stupid but it will be better case then fasulty radio ;-)

Any idea what to check?

Thanks for any input,

73!

Lexa, Ok1dst

Ok, I missed the phrase "Just before installing"

Have you done a reset of the microprocessor?

After that I'm scratching my head...

Thanks for reply, Clif,

the microprocessor reset is the first what I want to do
(lack of time yesterday and now in QRL, very tough time-tabel :-( )

then I want to check voltages around IC3 TC9174F on RF board
(responsible for filter switching bor both IF´s - as this problem is
with narrow filters in both IF
but seems to be strange that only OUT3, OUT7, OUT9 of this IO will
suffer and the rest will work ok...)

also will make revision of some caps for leakage etc...

I can report after at least first step (system reset).

Any idea more then welcome!

(It´s really a bad-luck as today recieved mentioned package from INRAD
with roofing filter :-( )

Thanks for care,

L. -dst-

I was wondering if anyone has used this setup before? I hooked it all up and set it up the way it was described in the propaganda that came with it, and all I get is gibberish when I put the marker on a signal in the waterfall. I am using the Digipan software.

Any info would be greatly appreciated.

Thanks

Rob

If you are seeing the signal on the computer the signalink is doing it's job. Try different software or a different mode.

Clif

I agree with Clif....I don't have a signal link but the problem is
usually in the software settings. I know this from experience. You will
get it figured out. I am assuming you are NOT familiar with Digipan.

make sure the sound card selected in the software is the signal link and not the installed sound card. computer noise can make you think you are receiving audio from the radio

I use the Signalink USB but not Digipan. Make sure you are getting a good level of receive audio if you have the Signalink going to the ACC2 like I do then you might have to jumper JP2 on the signalink like I did to get a good receive level into the signalink. ACC2 on the 850/450 has a low level audio output. I have been using mine for over a year and love it and it works flawlessly. You might also want to try Ham Radio Deluxe with DM780 it is by far better than Digipan I used Digipan about 4 years ago and did not like it then but that's my opinion.
Good Luck & 73

The set up I have is a TS450 , HRD , and the DM780 program in HRD , PSK31, the Signalink worked first time , never had a problem. The only thing to adjust is the jumper in the Signalink and make sure your computer is looking at the Signalink soundcard.

Here's a tip: Make sure that the 450 is in Upper Side Band and the software is set to receive in Upper Side Band. Use USB for all digital work.

was the cap replaced a new one?? It could still be a bad one.

recheck solder joints first, I have not heard of the ic being at fault, before...

also check voltages to the display board..

No problem. That was an easy fix. I think that 20 meters is going to be your best bet right now with PSK-31. The higher bands are dead. DXers like 20. I am about to buy one myself. I hope it goes as easy for me as it did for you. How do you like having the adjustments on your little box vs. screwing with the sound card controls in the computer??????

Steve , you did not ask me but hope you don't mind if I jump in. With the knobs up front all adjustments are simple. I just went into Windows once to tell the O/S to use the Signalink sound card , set my TS-450 per instructions and then all is with the little knobs on the Signalink USB . It could not be simpler.

From: Robert Cove
Topic: 8807 Message: 8824

Hello, Steve,

Not having used another type of interface before, I have nothing to relate it too, but the adjustments are very easy from the front of the Signalink. I was having a QSO with a gentleman who got my signal straightened out from his end and all is well now.

Rob VO1REC

No problem. That was an easy fix. I think that 20 meters is going to be
your best bet right now with PSK-31. The higher bands are dead. DXers
like 20. I am about to buy one myself. I hope it goes as easy for me as
it did for you. How do you like having the adjustments on your little
box vs. screwing with the sound card controls in the computer??????

Regards,

Steve, N4JQQ

8825. New member and first question re 500KHz tx use for TS690SAT and TS570S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-19 17:38:20 UTC
From: James Cowburn
Topic: 8825 Message: 8825

Dear group

Firstly, thanks for letting me join and 2ndly here is my question. I am active on the experimental 500KHz band in the UK and would like to use either my TS570S (I am a member of that group) and/or my TS690SAT as TX exciters for this band.

Both have been MARS/CAP modded and so TX down to around 1700 KHz but after that the TX is locked out. Is there a diode/chip to cut that will open TX to mirror that of Rx. I know that I'll still need to work on the bpf section too, but at the moment the brains won't even allow TX switching

Thanks for any pointers

Jim G7NKS

IO92UB

Active on WSPR 502.4 and also CW 501 - 503

8826. TS-450S Tuner Question

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-23 02:14:23 UTC
From: Crownhaven
Topic: 8826 Message: 8826

I tried to tune my TS-450S on a MARS freq, 403X tonite. It would tune my 80 meter antenna to that freq. My TS-870S and TS-850S give me an instant tune on the same freq, same antenna. Is there something different with the 450S tuner when working out of the amateur bands?????

Steve, N4JQQ

Steve,

Do you mean "It would NOT tune my 80 meter antenna to that freq."

Sorry about that Dan. Thanks for clearing that up. Yes, it would NOT tune my 80 meter antenna on 403X. Everything else is the same regarding the other two radios.

Hi
I find the atu in the 850 to be of a wider matching range than any other factory made internal atu I have yet used. I wonder if the 450 is just being stingy about its swr limits? There may be an adjustment for it to allow it to operate in loads worse than 1:1.

Chris

This is an amateur band specific thing. It will tune the antenna is about a milisecond at 3999.0. At 4.000, it won't tune the same antenna at all. It just grinds away. The TS-870S and TS-850S tuners will work out of band. I have never noticed this on the TS-450S. BTW, this is actually my TS-690S/AT we are talking about here. I can't imagine that it would make any difference but you never know. I will have to put my TS-450S/AT in line this weekend and see what it does.

At exactly 4.000.000 mHz the 450 tuner switches to the 40m configuration which is optimized for 7.150.000. That's why it will tune at 3.999.999 and not at 4.000.000

The TS-850 has a mode where you can manually tune it with the VFO and M.CH/VFO.CH knobs. Do these other transceivers have that mode? You might be able to at least see how low you can get the SWR that way.

Aloha Rupert,
Replace C18 on the display board and check for any bad traces that the old cap might have eaten up.
Roland AH6RR
Been there, Done that and even got the Tee shirt.

Morning all, KE0UE here, John F. Smeltzer in Colorado. I've had a TS-850 that I purchased new back in about 1990 that's been "resting" for a few years ... maybe up to about 10. It's been stored well, boxed and inside at fairly constant temps and low humidity. My inclination is to just plug it in and turn it on but I've noted in reviewing a large handful of posts that there may be some leaking component issues?

What recommendations do you all have for me to consider prior to lighting it up again? It's been a really great rig and I'd hate to cause unnecessary damage by being too excited once again to get her fired back up. Retirement can do that for you! Now I have time ... just not a lot of money and I'd hate to make that worse.

And ... if I need repairs are there recommendations on who to have work on it? Anyone in Colorado or southern Wyoming?

de Ke0ue K

I think the first thing I'd do is replace the battery. Then the caps. There is info in the files area about doing those.

Have you tried connecting your rig directly to the antenna? The problem may be in your amplifier T/R switching.

8841. For Sale: Kenwood SP-31 speaker

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-30 16:07:52 UTC
From: Brian Mileshosky
Topic: 8273 Message: 8841

Hi everyone --

I have for sale a Kenwood SP-31 external speaker. Aside from the great sounding 4-inch speaker and two switchable audio inputs, it has built-in audio filters which allows the operator to tailor the frequency response of received audio, reducing noise and improving the sound of signals. A great accessory for your TS-850 or any other radio in your shack. Includes manual and cable to plug into your radio. Speaker comes from a non-smoking shack, and is in great shape except for a scuff on the side. Price: $70 plus shipping within the United States from 87110. Money orders (preferably USPS money order) only please. I'm happy to provide pictures upon request.

73,
Brian N5ZGT
Albuquerque, NM

Have you tried connecting your rig directly to the antenna? The problem may be in your amplifier T/R switching.

8845. TS-850 and TS-690 for sale

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-01-30 20:33:27 UTC
From: Thierbach, Ed
Topic: 8845 Message: 8845

I've decided to step into the Software-Defined Radio waters, which means I have to sell a few things to fund the purchase of an SDR. Sadly, those few things include my TS-850SAT and TS-690.

The TS-850SAT is in very good shape, and has worked well for me. Serial number is 307xxxxx. Testing with a dummy load indicates that a previous owner did the MARS/CAP mod. Photos here:
http://s1015.photobucket.com/albums/af273/treetowntenor/TS-850SAT/
Asking $650 + shipping, will consider reasonable offers.

The TS-690 came from the estate of a local ham. I tested it and everything worked as it should. It hasn't seen much use in my shack, as the TS-850 above was my primary radio. Photos here:
http://s1015.photobucket.com/albums/af273/treetowntenor/TS-690/
Asking $450 + shipping, will consider reasonable offers

Take both for $1000 + shipping (such a deal! :-))

Shipping will be from 48103 (Ann Arbor, MI), by "trackable" shipping method (UPS, FedEx).

73,
-Ed- AB8OJ

On the RF unit check the RXB and TXB test points. In RX they should be 7.8v and 0.0 respectively. If RXB is low 1-2v then replace D31 on the same board. The suggested replacement is an MI204. It's not a surface mount but is easy to put in place of.

8848. TS-850 antenna tuner not working

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-01 22:01:32 UTC
From: nonenv
Topic: 8848 Message: 8848

Hi all:
I just recently bought a TS-850S with a built-in antenna tuner. And the tuner can't tune on any band or a dummy load.
After using a manual tuning mode described on the manual's page 30, I found that the main knob can turn the right side capacitor, but the VFO knob can NOT turn the left side capacitor. I can hear the motor running.
Is this a stuck or frozen capacitor? I already opened up the tuner unit and want to find out how to fix it. I didn't see any burned coil or other obvious problem. Should I wiggle the capacitor while the motor is running? Any hep is greatly appreciated. Thank you.

I personally use mine for HiFi SSB audio along with it's main purpose of acting as a 4th IF stage for the 850's receiver. I never touch any of the controls on the front and keep it fixed and wide open.
Coupled with this I did all the receiver mods to the 850 listed by NU9N / KA0KA for an extended receiver's bandwidth. I just control the receiver's bandwidth using the internal filters of the rig and control my audio's bandwidth the same way or by limiting by outboard audio processing equipment.

Thanks,

Topic: 8850 Message: 8857

Are you getting any audio in the receiver of the 850? I know that if you accidentally reverse the DSP-1 / DSP-2 cables (yellow / black), you will not get any audio from the 850 At all. Just start with basic cabling (been there, done that). The main 13pin connector also affects the entire system also.

Thanks,
Steve Restinetti

Hi Steve!

I going to check that out next. One of the cables is not a factory cable, but figured it should work.

I personally use mine for HiFi SSB audio along with it's main purpose of

acting as a 4th IF stage for the 850's receiver. I never touch any of the

controls on the front and keep it fixed and wide open.

Coupled with this I did all the receiver mods to the 850 listed by NU9N /

KA0KA for an extended receiver's bandwidth. I just control the receiver's

bandwidth using the internal filters of the rig and control my audio's

bandwidth the same way or by limiting by outboard audio processing

equipment.

Thanks,

Steve Restinetti

Hi Steve, and also everyone else who has replied!

The cables were checked and were in the correct positions. I was getting audio out of my 850, but could not make any changes to it.

I do have a question about the cables. Is there anything special about the cables? I figure they should be the same length, but is there anything special like swapped pairs or anything. I am asking because I know the 6 pin cable is not a factory cable.

Subject: RE: [TS-850_450_ 690] TS-850 & DSP-100

I personally use mine for HiFi SSB audio along with it's main purpose of

acting as a 4th IF stage for the 850's receiver. I never touch any of the

controls on the front and keep it fixed and wide open.

Coupled with this I did all the receiver mods to the 850 listed by NU9N /

KA0KA for an extended receiver's bandwidth. I just control the receiver's

bandwidth using the internal filters of the rig and control my audio's

bandwidth the same way or by limiting by outboard audio processing

equipment.

Thanks,

Steve Restinetti

Hi Ron:
Thank you for your suggestion.
I found out now that I can manually turn both the left side variable capacitor with the VFO knob and the right side variable capacitor with the MAIN knob. But when I put it into the automatic tuning mode the left side capacitor would not move. I don't know whether the motor for that capacitor did turn or not. Any hints?

BTW, I had a full output into a dummy load when I turned off the tuner. I can crank up the CAR to have that maximum output. It still didn't move that variable capacitor at all in the automatic tuning mode.

Thank you
73

Hmm ... that may be an indication of why you're having trouble with it tuning in auto mode. Looks like the left side capacitor motor or control circuitry is not working.

On the RF unit check the RXB and TXB test points. In RX they should be 7.8v and 0.0 respectively. If RXB is low 1-2v then replace D31 on the same board. The suggested replacement is an MI204. It's not a surface mount but is easy to put in place of.

I just wanted to say "Thanks!" to everyone that replied with advice on my DSP-100 problem. With the correct 6 pin cable, it seems to work just as it should. Doesn't do as much as I thought it would, but it is a nice addition to my Kenwood station just the same.

Thanks again & 73's for now!

Hi Steve, and also everyone else who has replied!

The cables were checked and were in the correct positions. I was getting audio out of my 850, but could not make any changes to it.

I do have a question about the cables. Is there anything special about the cables? I figure they should be the same length, but is there anything special like swapped pairs or anything. I am asking because I know the 6 pin cable is not a factory cable.

Hi Steve!

I going to check that out next. One of the cables is not a factory cable, but figured it should work.

So long as you use all 4 cables and plug them in correctly, should work. You

validated the cables?

Thanks,

Steve Restinetti

I personally use mine for HiFi SSB audio along with it's main purpose of acting as a 4th IF stage for the 850's receiver. I never touch any of the controls on the front and keep it fixed and wide open.

Coupled with this I did all the receiver mods to the 850 listed by NU9N / KA0KA for an extended receiver's bandwidth. I just control the receiver's bandwidth using the internal filters of the rig and control my audio's bandwidth the same way or by limiting by outboard audio processing equipment.

Thanks,

Steve Restinetti

Are you getting any audio in the receiver of the 850? I know that if you accidentally reverse the DSP-1 / DSP-2 cables (yellow / black), you will not get any audio from the 850

At all. Just start with basic cabling (been there, done that). The main 13pin connector also affects the entire system also.

Thanks,

Steve Restinetti

Well for me, I never touch the front panel controls, basically I have it set wide open with the rear panel Dip switches and use it for HiFi eSSB for TX and RX.
Pretty expensive toy for just sitting there but it’s worth it and I couldn’t have what I have without it! Whether you’re into eSSB or not, I for mine for a “steal” in price
Basically. Have fun with it and be sure to read the rear panels’ DIP switch functions…

Topic: 8848 Message: 8871

Hi Zack:

Thank you for your feedback.
Last night, I tested few steps.
First, I manually turned the left side capacitor (VC2) so I could view it easily. It would help me on the next thing.
Secondly, I reset it to the automatic mode. Then I cleared all memories so I didn't have any presetting on SWR.
Thirdly, when I turned it on again the VC2's motor actually TURNED automatically and stayed at the "opening".
I assumed now the VC2's motor is working properly. However, the signal was incorrectly sent and wouldn't move the motor to automatically tune the tuner. The VC1 works just fine.

In addition, when I manually turned the tuner I could NOT adjust it to lower SWR <5 while I used a 50 ohm dummy load. What did I do wrong?

Any hints would be greatly appreciated. Thank you.

From: Zack Widup
Topic: 8848 Message: 8872

Interesting! First off, when you manually tune it now, can you tell if the capacitor actually goes through its entire range when you rotate the control?

It is possible that something has slipped and what the computer thinks is the capacitor's minimum and maximum positions are no longer true.
I haven't actually ever had my tuner apart so I'm just kind of guessing here. It seems the only way you couldn't get a 1:1 SWR with the tuner into a dummy load would be if one of the tuning caps wasn't going through its whole range. Either that or there is something wrong with the SWR bridge circuitry also.

You probably know this, but make sure your power output is at least 10 watts, too.

hi im new here and would love some help... i have the ts450 and to me it seems as if the agc is a touch quick on the slow setting is the any way to change the decay of the agc..?? thank's

also any one tell me the correct setting for vr14 i think its the ALC adjustment if there is a test point and what the voltage shud be..??

thank's again regards sean

Sure, change the time constant resistors and caps.

VR14 does set the reference voltage for the ALC. Might I suggest if you don't have the service manual you don't adjust it. Why do you think it needs adjusting?

The 690 is sold. I still have the 850 for sale, now for $600 or best offer, + shipping.

Topic: 8876 Message: 8876

Hello to all I am new to this group an I have a question about componet in my TS-690S with the top cover removed an the smaller cover removed onder the main top cover there are two glass bulb looking parts right next to the hf an 50 mhz antenna connectors. are these diodes or what an if they are whats the name of them an where can they be purchased? one of them in my rig looks kinda cloudy like that if might be fixing to go out an the other is nice an clear. any one can know? thanks for reading Dennis N5LED.

hi clif i do have a service manual to the 450 but it says that the reading is on cn1-7 reading 2.5v which mine does not read on a dcvm..!!! its approx 1.5v if anyone with a ts450 could be so kind to read the voltage cheers... im asking this as someone has adjusted it as they told me so it was being used on cb and has been messed with..!!

8878. Re: [TS-850_450_690] help

From: Dave ve3wej
Topic: 8876 Message: 8878

they may be diodes as far as I can remember, cloudy on the outside or inside, they may NOT be the exact same part

Is the rig working ?? why replace it if it is.

if you have the service manual, board layout would tell you for sure, or maybe a clear photo and upload for the group to see....

if you could id the component number, or nearby parts, and the board number , we should be able find out what it is...

They are surge protection diodes.

Hi Zack:
Thank you for staying with me.
Here are what I found so far:
1. Both VC1 and VC2 can be manually turned by the main knob and VFO knob respectively in the manual tuning mode.
2. Only VC1 can be turned automatically in the auto mode.
3. Both VC1 and VC2 can be automatically reset when reset (clear A=B) mode is entered.

I replaced the battery in the digital board as few suggested. However, the problem where VC2 can NOT be automatically turned is still there.

I think the signal sent by the "microprocessor" from the digital board is not correct but I have no way to check it. At this moment I have no solution.

The VC1 and VC2 as designed they don't turn a full circle. They will turn one direction then reverse its direction as designed.

How do you check the SWR circuitry?

OK. It could be that the microcontroller circuit is bad. I haven't done anything with the ATU circuit so I am not sure how to track it down. You probably need an oscilloscope. I'll look at the service manual.

If thw SWR meter on the radio shows 1:1 when you're transmitting into a dummy load with the tuner out of the circuit ("THRU") and shows something else when you're going into an antenna, I'd say it is OK.

Is there a difference between the ts-850 and a ts-850s. I know that SAT means digital readout with auto tuner for Kenwood, but I see this rig referred to as 850 and then they talk about an 850s.

73,
Bob AD5VJ

i have never seen the radio refered to as just ts850, except by radio ops. I have always seen them as ts850s or sat. they have always had a digital display, unlike the 820 series..

Ok that is a relief, a guy is talking to me presently about owning his 'TS-850 like new' radio and I started some research on the model since most of my experience and acquaintance is with Icom and Yaesu.

Don't know how I missed Kenwood along the way after so many years of operating, but I did. Anyway, just wanting to make sure it is a radio worth replacing an IC-761 with.

Thanks
Bob AD5VJ

ello everyone. I recently got laid-off so I am selling off some of my equipment, I am selling my LP-PAN (for kenwood) and EMU 0202 sound card as a package deal with all the cables to hook it to the TS-850S and computer. It was an assembled kit from Larry and it looks and works like new. I am asking $225 plus $11 shipping priority mail. Let me know offline if any you are interested. I will take Paypal

Mike, N4GW
contact me at starmike@bellsouth.net

I will also be selling my TS-850SAT soon as well once I get it written up

8887. FS: KENWOOD TS-850S/AT with INRAD Filters and Upgrades!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-10 14:24:22 UTC
From: jchristi40
Topic: 8887 Message: 8887

KENWOOD TS-850S/AT with INRAD Filters and Upgrades!
THIS IS THE ONE YOU HAVE BEEN WAITING FOR!

Up for sale is my Kenwood TS-850S/AT Transceiver. The rig is in excellent condition and working at full specs. I am the second owner of this fine rig. The original owner bought it new; hoping to get interested in HF, and never did, so when I bought it from him 2 years ago, it looked like new

If you are looking at this post, you know how much of a performer these radios are. The TS-850s have a well-known reputation for being an outstanding DX/Contest rig, as well as for casual use. When needed, they can pack a lot of punch. Just kick in the High boost control, and the true RF speech processor, and you have a pile-up breaking signal. I have broken through many pile-ups with this combination.

Sale includes the radio, mic, power cord, amp relay cable, PC control serial cable, original manual and original box. It has two INRAD filters installed. 2.1 kHz in the 8.33 IF and a 1.8 kHz in the 455 IF (cost of $350)

At the end of 2008, this radio also received the "FULL MONTE" treatment from B&B Technical services (cost of $300). See link: http://www.eham.net/reviews/detail/3784

This included:

☐ Replaced the battery for the main CPU
☐ DC-DC converter mod: prevents and fixes ALC "dumping" problem.
☐ Noise blanker mod: Simple removal of two capacitors, near where the DC-DC converter mod is done and greatly improves the NB
☐ Replace the surge arrestor tube at the antenna lead-in and add a pi-wound choke in parallel with the arrestor. The choke bleeds DC off the antenna lead-in, helping to preserve the surge arrestor tube (which will still "fire" on fast-rise-time stuff such as lightning and static hits). Long wire antennas can cause a significant DC charge to build up from wind and precipitation; this will blow the surge tube and may cause damage "down the line" to the receiver bandpass filter diodes (not to mention removing your protection for later "hits").
☐ Checked the RF unit and replaced D35. This is the diode that gets "punched out" by the aforementioned DC surge. If D35 is leaky, all sorts of weird things happen to the 850.
☐ Checked the IF unit and replaced the audio output blocking cap. These get dried out and short, blowing the audio amp chip.
☐ Checked the front display unit and replace C17. This cap likes to leak on the board and eat up the trace that feeds 8V to the display power supply unit. If you have a dark display or one that likes to cut out, this is the culprit; if not, it will eventually be a problem.
☐ Clean controls as needed.
☐ Checked the AT unit, lubricate metal bearing points.
☐ Set final and driver bias (200mA each).
☐ Check the IF unit, add the CW sidetone LEVEL mod. This brings the sidetone LEVEL (not pitch) adjustment to the front panel MON control; a real plus for any CW operator. SSB MON function is unaffected.
☐ Replace Caps - C1 (47uF/16V/SMD) and C4, C8, C10, C15, C20, C22, C25 C27 and C66 on the CAR unit; these caps leak and will cause PC board damage.

☐ 60M transmit mod
☐ Lube the VFO main- and sub-encoder shafts (used Mobil One synthetic oil).
☐ Align RF and IF stages
☐ Adjust power output min and max; MIN goes from ten watts down to 4.5 watts; this makes you "legal" for the QRP contests and much easier to shoot for a QRP QSO, just turn the POWER control full CCW and you are under 5 watts! MAX can go to +100 watts.

You will not find a better TS-850 for sale than this one. B&B Tech said it should last another 15-20 years with these upgrades. You will not be disappointed with this radio. Due to its age, no warranty is expressed or implied, but the rig will not be DOA. The only reason I am selling this fine rig is I have been recently laid off, and I am selling off any equipment that I absolutely do not need.

The serial number is 30400335

Check what others are saying about this rig on eHam:
http://www.eham.net/reviews/detail/4

Check out this radio is use from my YouTube videos:

8891. TS690 50Mhz S-Meter problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-11 15:34:01 UTC
From: Mansueto
Topic: 8891 Message: 8891

Hi All,
I own a TS690 (50 Watt 6M version) and recently I noticed that on switch-on the S-Meter slowly goes to full Scale and stays like that for over 20 minutes. Any signal during this period, unless very very strong, is not audible. I tried on other bands and at present this problem is not noticeable. I believe it an AGC problem, usually from a bad Capacitor. So before I put my hand in it, has anyone suffered from this problem?
Any info is highly appreciated.

8894. Re: [TS-850_450_690] TS850 calibration

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-12 20:52:48 UTC
From: Steve Gehring
Topic: 8888 Message: 8894

This procedure has worked well for me in the recent past*: *****

A Quick Dial Calibration Check (thanks to K6LL):

1. Tune the radio to 10Mhz, so you can hear WWV.

2. Press the "tune" button on the radio (keypad #7).
3. Set vfo A to 10000.10 KHz, or 10000.50 KHz [Use the keypad for exact frequency entry with the synthesizer].
4. Set vfo B to 9999.90 KHz, or 9999.50 KHz [Use the keypad for exact frequency entry with the synthesizer].
5. Flip back and forth between vfo A and B. On both, you should hear a low tone of about 100Hz [or 500 Hz if you choose the 500 Hz offset], just off zero beat of the WWV carrier. If the tones are not equal in frequency, adjust TC-5 on the PLL Unit, as follows:

TS-850 Quick Dial Calibration

6. Remove the TS-850 top cover.
7. There is a three-stack of boards on the left side of the radio. On the left side of the lowest shield, there is an elliptical cutout. Peek inside, and you will see the screwdriver-adjustable pot TC-5.
8. Make small adjustments to TC-5, and repeat step 5 above until the two tones are exactly equal in frequency.

It works...

8895. Weird meter readings using SW-2000 with TS-850SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-15 15:38:40 UTC
From: professorsolderflux
Topic: 8895 Message: 8895

Haven't seen this issue covered in posts here or elsewhere, so here goes:

I have a handsome little Kenwood SW-2000 Power/SWR meter connected to my 850 and TS-790A via the appropriate couplers (SWC-3, SWC-2 respectively). All connections are correct and secure. The coupler switches are correctly positioned at the back of the meter. The HF antenna is an 80m dipole fed with 50 ohm coax, and shows a best match of 1:1.2 on 80m using my MFJ-269 analyzer.

Now, this may be the key to the weird readings: The SW-2000 instructions show connecting the meter BETWEEN the radio and an antenna tuner and antenna. Of course the TS-850SAT has an internal automatic tuner that places it BETWEEN the radio and the meter instead.

Here's the weird readings:

With the 850 AT button in THRU position (AT bypassed), the SWR meter calibration can be made, and shows a 1:1.5 match. But in the Power position the meter will only read about 20W even though I'm running at full 100W radio output.

With the 850 AT button in AUTO position (AT engaged), the SWR meter calibration cannot be made, and at maximum setting of the calibration knob, will only cause a 65% deflection of the SWR meter (35% short of the CAL mark). The SWR meter shows a mis-match of full scale. But in the Power position, that meter will now read the correct 100W radio output.

It seems like maybe I'll have to use the THRU setting (AT bypassed) to read SWR, and return to AUTO position (AT engaged), for normal operational power readings.

I should add that there are no smoking coax cables or radios when using the AT, even though the meter shows a mis-match of infinity! :-)

I gratefully welcome any experience or insights on this issue.

Thanks and 73
Ron KØGOP (aka PS)

Hi, Ron...

I'd first suspect the SW-2000 meter or couplers (fairly simple to check, and relatively cheaper to replace). See if someone has something like a Bird Thruline power meter, or barring that, another known good power meter you can borrow for a bit for comparison.

8897. An interesting fault in a TS-850S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-16 07:20:18 UTC
From: Jose V. Gavila
Topic: 8897 Message: 8897

Hello!

This last weekend I have been working on a Kenwood TS-850S with a fault I had never found before nor have found documented on the WEB (see note at the end)

Symptoms were some very strong noises coming from the speaker, even without antenna connected. S-meter signals were up to about 9-9+20dB. Noise was like static crashes and didn't have a repetitive pattern. From time to time, they were gone. But, luckily, most of the time noise was present.

I first thought on CAR UNIT faults, but oscillators were clean and I found that CAR UNIT SMD capacitors had been already replaced. I checked also AF amplifier area, which was OK. Then I checked IF signals and the noise was there, of course, but the cause for it was not found in the signal chain from AF to second IF. I found that disconnecting the receiving IF cable from RF to IF PCB (8.83MHz IF signal) eliminated the noise, so it shoud be closer to the antenna... The problem is that signals are of a very low level at first RF stages so they can't be seen with the oscilloscope.

I then checked power supplies and, yes, there was some noise on them. But just some mV. I thought that noise was not the cause but the result of whatever generated that noise.

I went back to schematics, trying to find what could cause such erratic noise. RF amplifiers seemed OK and noise on them was barely visible, again in the power supply. Then I saw in the RF UNIT schematic an small digital transistor which switched on an attenuator on RX section when trasmitting... could that be the problem?. I put the oscilloscope on the collector and, BINGO, there it was!!!. The transistor was switching on and off by itself!

As it is only useful when transmitting, I removed it from the circuit and then a perfect reception came back. GREAT!!! (of course, I later replaced it with a new one)

For your reference, transistor is Q49 (DTC124EK), located on page 121 of Service Manual (both PDF and real page numbers are the same), on the top left corner, labelled as RF SW

Hope this saves someone the work to locate a similar fault!

Best regards,

JOSE

Note: now that I know that it was Q49, looking on the WEB and on this Group for TS-850S and Q49 reveals this transistor can also generate low sensitivity and trasmitting problems, but the cracking noise seems to be not documented.

Hi Clif,

>Not documented but well known, at least to me, just nobody asked....

OK, but that, for people like me who has not worked in so many 850s as you have sure done (I have fixed a mere dozen or so), is the same that not being documented. For myself it was a discovery, even if I was not the first one to find it, as I suspected.

At least now it is written for future users :-)!

Thanks and best regards,

JOSE

My comment, on second reading, didn't sound right. My apologies. I imagine it took me more time to find it the first time than you.

Now for your notes. The exact same circuit is used in the 450/690 radios. The 570 and 870 have a variation.

8904. Re: [TS-850_450_690] Weird meter readings using SW-2000 with TS-850SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-16 13:51:12 UTC
From: John Merrill
Topic: 8895 Message: 8904

I might try changing the length of cable between the radio and the meter.

On Mon, Feb 15, 2010 at 8:38 AM, professorsolderflux <ron@...> wrote:
> Haven't seen this issue covered in posts here or elsewhere, so here goes:
>
> I have a handsome little Kenwood SW-2000 Power/SWR meter connected to my 850 and TS-790A via the appropriate couplers (SWC-3, SWC-2 respectively). All connections are correct and secure. The coupler switches are correctly positioned at the back of the meter. The HF antenna is an 80m dipole fed with 50 ohm coax, and shows a best match of 1:1.2 on 80m using my MFJ-269 analyzer.
>
> Now, this may be the key to the weird readings: The SW-2000 instructions show connecting the meter BETWEEN the radio and an antenna tuner and antenna. Of course the TS-850SAT has an internal automatic tuner that places it BETWEEN the radio and the meter instead.
>
> Here's the weird readings:
>
> With the 850 AT button in THRU position (AT bypassed), the SWR meter calibration can be made, and shows a 1:1.5 match. But in the Power position the meter will only read about 20W even though I'm running at full 100W radio output.
>
> With the 850 AT button in AUTO position (AT engaged), the SWR meter calibration cannot be made, and at maximum setting of the calibration knob, will only cause a 65% deflection of the SWR meter (35% short of the CAL mark). The SWR meter shows a mis-match of full scale. But in the Power position, that meter will now read the correct 100W radio output.
>
> It seems like maybe I'll have to use the THRU setting (AT bypassed) to read SWR, and return to AUTO position (AT engaged), for normal operational power readings.
>
> I should add that there are no smoking coax cables or radios when using the AT, even though the meter shows a mis-match of infinity! :-)

>570 and 870 have a variation.

OK, thanks!. BTW, once I found a deafening effect in a similar circuit also on a
TS-2000. It is good to know those small transistors are there and are prone to
go if there is excessive RF in the antenna.

Best regards,

JOSE

Taking about noise, I find the carrier insertion of the TS850 is rather noisy compared to other radios.
What I mean is on AM the signal to noise is most excellent, but when switching to SSB or CW you would expect some more noise, but I think on the TS850 is rather high . Phase noise ?

Hi Dennis

Do you have vox on? vox has to be on to send CW.

Does it work in the other modes?

If it doesn't work in the other modes, you may have to go to the menu by holding in the LSB/USB key when turning the rig on. Then make sure that menu item 19 is set to OFF. 73 and GL

switching to SSB or CW you would expect some more noise, but I think on the
TS850 is rather high . Phase noise ?

Paul
9H1FQ"

Hi
I think the "noise" you are noticing when in cw/ssb is not phase noise as the 850 (when aligned to specs) is very clean in that respect, but rather band noise that is allowed through to your ears by the lack of a hang agc action. The decay is still too fast in the slow agc position as far as I am concerned.

Chris

Hello!

Well, I have fixed about a dozen TS-850S and none had any damaged DDS chip... until the one which has arrived today from a local radioclub. It had lots of leaky caps in the CAR UNIT, as usual, but the condition seemed to be quite right, with almost no decoloration on the PCB. So I have removed caps, cleaned residue and put new caps, as I use to do in these cases. But no joy. A couple of DDS chips (which in fact are the newer 66312 units) are dead, measuring about 5 Ohm from power input to GND.

So I wonder if someone has any spare around (DDS chips, complete unit, ...)

I would even buy a damaged CAR UNIT with one or more good DDSs, to salvage them.

Thanks and best regards,

JOSE

Hi Jose,I have a CAR BOARD with no DDS chips on it but its in reasonable condition, all the caps have been removed also and it shows signs that the caps have been leaking before removal, i also have 2 YM66312 chips that are in working order because i bought them from EAST COAST TRANSISTOR just before they went obselete, i did have 4 but sold 2 to a local ham for his TS450 and then realised i had made a big mistake when i tried to replace them, i did have these chips mounted on the CAR BOARD that i have because i was planning to salvage the board but i took them off after i sold the other 2, these 2 chips have never had power through them so are still in new condition but with no boxes, i also have an old chip (6631) that i believe is still in working order, if any of these items are of use to you then contact me and i will send you pictures of what ive got, iam sure i still have the receipts for the 66312s that i can show you.

John

8917. TS850 Cap/bad trace replacement question

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-22 18:59:34 UTC
From: va3jff
Topic: 8917 Message: 8917

Hi All.

I opened up my TS850 this weekend to see the condition of the carrier board caps. Luckily, the previous owner must have done this as well, as the 47uF cap had already been changed out. Of the ten 10uF caps, nine are still in good condition, although they are the originals.

The last 10uF cap has started to leak, and it has lifted the trace. It is the cap on the top right corner of the board nearest IC4, and the trace in question seems to run under the DDS chip - and of course broke off really close to the chip. I don't see an easier tie-in spot for the trace ... is there a more convenient location?

Thanks.
Jeff - VA3JFF / VE3CW

The members of this group work fast! I received a picture with a description letting me know where that trace leads to, and the repair will be easy and straight forward, and I get to keep the DDS chip in place which will certainly make life easier.

Thanks!

Jeff - VA3JFF / VE3CW

Anyone needing 0.01uf 0.3% (yes- zero point three percent) capacitors can have a look here. They are a bit bulky for solid state circuits, more suitable to valves:

Curt not a problem N1mm works great with the 850 all you need is an
interface. G3ZLP http://www.g4zlp.co.uk/unified/KenwoodCAT.shtml
has a plug and play one that is great i have 6 of them for my
850's950's and 870's. takes about 5 days from the UK.

I am using one of the G3ZLP interfaces on my 850 and I have no problem with N1MM, HRD, MMTTY, XMLog and a bunch of other programs they work great. Very simple to setup you just need to tell the software the correct com port where the radio is. If you use a USB to RS232 then you need to find out what com port it assigned it to. After that its all ready to rock and roll.

Speaking of interfacing an 850 I may be owning one soon what it the best interface available out there other than the 100.00 IF-232 that seems a little steep for a level controller. And do you have to have an operational board installed in the 850 or do they come stock in them.

Hi Steve

Yes, they have been released along with the service manual. The black and white version that you can found on internet have been taken from a coloured original version that included PCB layout too.

I have found a couple of pages on internet but nothing more.

But they exist. So if you know where i can download them i will be really glad

Antonello

Hi Antonello,

For what are these mods good for ?? I never heard about them before...

Concerning colors diagrams, i have the service manual and diagrams as well as layouts are in colour (red and black)

I'm not ready to scan everything but if you need a particular board, i will see wht i can do at work where we have an A3 scanner.

Ciao & 73 , Patrick TK5EP

Hi Patrick and thanks for reply.

These mods have been thought and projected by Giancarlo Moda I7SWX who realized also some kits for the radiohams that want to make these mods.

At present we have 3 main mods ready.

1) Replacing of RX 2nd mixer with an H-mode mixer

There are mixers that make use of the Fast Bus Switches (FST3125, FST3253 - I7SWX) and recently the analog switch (FSA3157), the latter applied in particular the H-Mode Mixer developed by G3SBI.
These mixers allow approximately +40 dBm IIP3 and up to +50 dBm, requiring low power values of the oscillator. The results are more selectivity, lower intermodulation and lower noise.

2) VCO PSU filter

Many voltage regulators have excessive noise output, including circuit-switched pulses and spurious variables by references unfiltered.
The usual three-pin voltage regulators have several hundreds of nano-volts per root hertz of white noise and some components of the reference voltage exceeds
a microvolt per root-hertz.
DC-DC converters and switched regulators may have switching product around millivolt and covering a wide spectrum of frequency. Furthermore, many systems
have stages or components that "dirty" power lines, basically clean.
This is a circuit for reducing noise PSU and must be inserted in the supply line of the VCO to decrease the ripple present with the possibility of reducing the phase noise.

3) Rf preamp mods for better signal/noise ratio.

Others are to came on such as insertion of a diplexer in front of a roofing filter, panoramic receiver and 2nd RX.

All these mods have been applied with success on other rigs such as icom 775, yaesu FT100 etc. improving their performance a lot.
Measurements have prooved that these modified rigs are equal and even better of last produced rigs as ic 7800 and similar.

Giancarlo says that same result can be achieved on TS-850 and many other old rigs.

But regarding TS-850 i am the only crazy guy experimenting his solutions at moment ! HI

About the schematics it will be nice to have at least a copy of RF BOARD PCB layout, front and rear side.

If you can do that, it will be very helpful.

If you need more explanation you can write me to iz8itt@...

Thank you in advance for your kindly help

Ciao

Topic: 8922 Message: 8937

Hi I believe all that is stated here is true.

There is an unpublished mod by Thomas Hohlfeld for the front mixer of the Kenwood TS-940 that also achieves the IP3 +40 Db performance,

So a number of persons are experimenting with these improvements.

Please keep us informed of your progress.

Yours sincerely

ZL4AI

To: TS-850_450_690@yahoogroups.com
Subject: [TS-850_450_690] Re: Looking for TS-850 color schematics and PCB layouts

Hi Patrick and thanks for reply.

These mods have been thought and projected by Giancarlo Moda I7SWX who realized also some kits for the radiohams that want to make these mods.

At present we have 3 main mods ready.

1) Replacing of RX 2nd mixer with an H-mode mixer

There are mixers that make use of the Fast Bus Switches (FST3125, FST3253 - I7SWX) and recently the analog switch (FSA3157), the latter applied in particular the H-Mode Mixer developed by G3SBI.
These mixers allow approximately +40 dBm IIP3 and up to +50 dBm, requiring low power values of the oscillator. The results are more selectivity, lower intermodulation and lower noise.

2) VCO PSU filter

Many voltage regulators have excessive noise output, including circuit-switched pulses and spurious variables by references unfiltered.
The usual three-pin voltage regulators have several hundreds of nano-volts per root hertz of white noise and some components of the reference voltage exceeds
a microvolt per root-hertz.
DC-DC converters and switched regulators may have switching product around

millivolt and covering a wide spectrum of frequency. Furthermore, many systems
have stages or components that "dirty" power lines, basically clean.
This is a circuit for reducing noise PSU and must be inserted in the supply line of the VCO
to decrease the ripple present with the possibility of reducing the phase noise.

3) Rf preamp mods for better signal/noise ratio.

Others are to came on such as insertion of a diplexer in front of a roofing filter, panoramic receiver and 2nd RX.

All these mods have been applied with success on other rigs such as icom 775, yaesu FT100 etc. improving their performance a lot.

8938. Schematics for TS-850S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-02-28 17:42:57 UTC
From: jeff@123jeff.com
Topic: 8938 Message: 8938

Hi Antonello,

A very good pdf scan of the complete TS-850S service manual is at VooDoo's site:

http://www.wz5q.net/index/manuals.htm

Recall that pdf files usually contain much more detail than gif/png files and way better fine quality than jpg files. pdf files can thus be enlarged in spots as necessary to read component values or notes. He gave us a large amount of overlap where large pages were scanned as pieces into a standard letter/ A4 acanner.

I had schematics and board layout files in color at one time, but that laptop was stolen. (Yes, my children, backing up data is a Good Idea...) :) Fortunately I did print them out. I'll keep looking...

Topic: 8939 Message: 8939

Just to make it quite clear.
All the LCR circuits and software which I have mentioned do not give accurate readings for ferrite and dust core coils. They are only suitable to audio coils and aircore coils

Another commercial product is the henrytest

http://www.henrytest.com/

Hello Jeff

Thanks for reply.

I already have it.
I am really sorry that you lost your laptop data.
Just in the case you are able to recover some, i wish to have at least the colour PCB layout of RF BOARD.

In any case thank you for your kindly help

The only way I found to get these is to send the unit to the Kenwood repair station in Lynn Haven, Virginia. Do not tell them that you need the chips, just tell them the symptoms the radio has and that it does not work. They have a stash of chips they do not admit to having and will not sell, but will put them in your radio if you send it to them.
Benn there, done that, bought the T shirt!!. I also got a whole new display board and all the capacitors replaced by sending it in!!

Dan
So which one are you using with your TS-850? Does one need to buy any extra chip to be installed internally? Thank you.

I also have a 850 and found out that DDS chips marked part number 6631 are the bad earlier ones and DDS chips 66312 are the later chips that are good. Have a look at the chip identification to determine which you have. I'm not sure what radio serial number that the newer chips were started to be installed.

I forgot to mention. If someone offers you the new chips, the paperwork
and boxes continued to be marked 6631. If you pull the chips out, they
are marked 66312. Might save someone some angst.

I don't know the serial numbers. I am sure Clif does. However, I have one of the very first TS-850s here. It has gotten sick a couple of times but the chips in it have never been replaced to my knowledge. I recently had the good fortune to pick up a second TS-850S for an incredible price. It is loaded with INRAD filters and the owner sent along four YM6631 chips that he bought from East Coast Parts in 2008 and never had to use. The slip from Kenwood says they were made in January, 2003. I bought my first TS-850S in 1990, more or less, as I recall.

Even though both of my 850s work fine, I bought the second one as a source of parts if the world ever ended.

serial number woould not tell you if the older model (they are all old) had them changes, a visual inspection is required, and from what I hear, it makes no difference because other say they are NOT available...

Hi
my 850 have 30900645
serial number with new generation of DDS

May be this help you

IT SURE WOULD HIHI thanks for the info hope mine are updated, guess I will know soon, I am so excited abt getting the rig, I had an FT-1000MP MKV and according to the stats on the Sherwood site it is much better on rx than the one I had so I am really excited about hearing this rig on cw especially.

Now the challenge is to pick out an INRAD filter combination for CW contesting without hindering SSB reception.

I have two 500 Hz filters in one of mine and an 1.8 SSB filter. The other one has a 500 Hz and 250 Hz filter as well as the 1.8 SSB filter. I am not a contester but I don't like the 250 combination. I do chase a lot of DX, on CW, and the two 500 Hz filters suit me the best. I actually like to listen for CW signals using the 1.8 filter. My TS-870S has a CW filter setting that is only 1000 Hz at the widest which is too narrow for me.

When you get the rig, Bob, open it and look at the CARRIER board. Check to make sure the electrolytic capacitors aren't leaking. This is a primary sore spot of early TS-850s and can create trouble.

FYI;

I have a TS-850S/AT with s/n 30200393 that came with the original 6631 chips.

So, sometime during that production year (3 million series) the chips were changed over.

In my 850 are installed the 400Hz INRAD CW filters (# 103 and #104).
They work very well. The INRAD filters have much better skirts than the
Kenwood 500Hz filters. Slope tune works fb with this combination.

I do not use phone very often, so the stock 2.7kHz filters work fine.

My s/n is 30600519 - it has the 6612 chips in it. They have not been a problem to date but I have replaced all the carrier board electrolytic caps as well as the ones on the display board. I've also replaced the four electrolytic caps associated with the AF output amplifier on the IF board (do the cw sidetone mod while you have that board out).

It's been a good rig - I bought it new in January 1993.

Sounds good on the filters, I work ssb but only on nets like swap nets was nets etc I like DXing and contesting in cw so the 400hz INRADS seem like my choice also.

How can I tell if the caps have been changed? Is there a certain set or color to look for?

Tnx

Hi Bob,

I don't want to trash your party ;-) but the unit I am working on, being a late serial number and having the new DDS chips, has two bad chips.

I have traced the problem to a short produced by leaked electrolyte so it does not matter, in this case, if DDS chips are newer or not.

So my recommendation for ALL AND EVERY 850 is to CHECK CAR UNIT CAPACITORS and replace them if they are the original, even if they _look_ fine. Most times, when replacing good looking units, you see leaking has started at the bottom of the capacitors.

Best regards,

JOSE

Hi Jose

No problem with crashing the party, I want to know as much as I can find out abt this rig. I am reading the manual right now with the excitement of a kid in a candy store.

Someone tell me abt the two filter controls on the front panel. It says that no matter the mode I can select the filter in the 8mhz and 455khz sections by pushing the switch, this is not like any rig I have had before how does that work?

It sounds like if I had a 500hz filter and a 250hz filter in each section respectively I could select both filters at the same time, not sure what bandwidth that would result it though.

Hello Bob,

>No problem with crashing the party, I want to know as much as I can find out
>abt this rig. I am reading the manual right now with the excitement of a kid
>in a candy store.

I understand you perfectly :-)!

>Someone tell me abt the two filter controls on the front panel. It says that
>no matter the mode I can select the filter in the 8mhz and 455khz sections
>by pushing the switch, this is not like any rig I have had before how does
>that work?
>
>It sounds like if I had a 500hz filter and a 250hz filter in each section
>respectively I could select both filters at the same time, not sure what
>bandwidth that would result it though.

Yes, filters are cascaded in the two IFs. You can select any combination, one for each IF. So if you select 500Hz in 8.83MHz IF and 250Hz in 455kHz IF, in an ideal world, you would have 250Hz BW. But, as filters are not ideal, you have some noise coming from the 500Hz BW of the precious filter, entering in the skirts of the 250Hz filter. Of course, if instead of the 500Hz you use the 2.7kHz standard filter, you would have a bit more noise. So all filters help. INRAD filters have steeper curves so you get a bit less noise with them.

Best regards,

JOSE

From: Roland AH6RR
Topic: 8965 Message: 8965

When you change the filter width it will only be what the narrowest filter you have installed. Say you have a 400hz in the 455khz slot and a 250 in the 8.83 Mhz slot it will narrow it down to 250hz.But if it were me I would only use matched filters ie 400hz or 200hz. And for SSB filters I would go with the 2.1 Khz Inrad I have them installed in both IF's for my Phone contesting work. I do plan to get a 400 Hz for CW soon for the 8.83 Mhz IF. Also I would think about the Inrad Roofing filter it help's a bunch on a crowded band. I have had one since they first came out with the mod.

Hi Bob,

I don't want to trash your party ;-) but the unit I am working on, being a late serial number and having the new DDS chips, has two bad chips.

I have traced the problem to a short produced by leaked electrolyte so it does not matter, in this case, if DDS chips are newer or not.

So my recommendation for ALL AND EVERY 850 is to CHECK CAR UNIT CAPACITORS and replace them if they are the original, even if they _look_ fine. Most times, when replacing good looking units, you see leaking has started at the bottom of the capacitors.

Best regards,

JOSE

Ok good deal looks like our radios from vintage '95 are updated already, I hope so according to the serial numbers yours and mine were in the same year just different months yours being 5 months younger than mine from May of '95

Thanks

Hello Bob,

>Jose, Can you please give me a rough idea of how
>long it takes to get the carrier board out and
>approx how many capsÂ should be replaced?Â Thanks!Â Bob NÂ WE6C

Yes, it is pretty easy. Just remove both covers
(it is better than removing only top one, to have
better access to the screws). Then, on the top
side, there ia a board with some switches to
select installed filters. Remove it along the
metal base which supports it and just below you will find the CAR UNIT.

It has ten 10uF/16V and one 47uF/16V SMD caps. I use 35V units to replace them.

You can see some detailed pictures on my WEB at:

http://www.jvgavila.com/wb7.htm

BTW, once there, replace the display capacitor
which is also a source of troubles.

Best regards,

JOSE

Hi Harold,

>Jose what is the value of the display cap and do u know as to were i can buy
>them ,,, i have 2 very nice 850`s with low time on them,, and have been going

>to ask what i needed this just got me in gear THANKS N5TOG HAROLD

It is a 470uF/16V (at least this is what I used to replace the damaged one, as you can see in my WEB, so original would be similar). Look for a low profile unit, so you don't need to resort to put is on its side, as I did :-). On later repairs I found a more suitable unit. You can get them at any electronics store or by mail (Digikey, Mouse, Farnell and such)

Even if display is still working, you need to carefully clean the area below and around it with alcohol, as leaked electrolyte could be in process of damaging the tiny PCB vias.

Regards,

JOSE

8978. TS-850 SAT computer control/ amp relay control conflict??

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-04 23:17:10 UTC
From: Bob AD5VJ
Topic: 8978 Message: 8978

I have a new to me TS-850SAT on the way.

Should be here tomorrow or the next day so I am preparing a home for it. I have purchased a cable for computer control and I am fashioning an interface for digital modes. I also want to do true RTTY so am attempting to configure that in the modified RASCAL box I am using for soundcard modes.

The issue and question I am having right now is. Since the computer control cable takes up the 6 pin connector for computer control how do I also use the relay control for my external DRAKE L7 linear? I can hook up the ALC control with the phono I already have configured, but how to I get relay control for the amp.

73,
Bob AD5VJ

different connectors.. computer control is 6 pin acc jack, relay is 7 pin din plug along the bottom row

sound card , I use the 13 pin connector

Gtg

I am configuring 13 pin (acc2) now for sound card.

The 6 pin (acc1?) I have at the end of the 9pin rs232 connector ready to go.

Here is the question then:

Linear amp switch in the on position.

I need to configure the 7 pin labeled 'remote' for the amp, which if I am reading the manual correctly 2 and 4 is my relay to my DRAKE L-7 RLY PHONO plug which is looking for a normally open circuit with 4 as the center connector and 2 as the outer conductor.

6 and ground is the alc control PHONO with 6 as center and ground as the outside connector on the phono is that correct?

I just installed the YK-88C-1 and YK-88SN-1 in the two IF slots and the YG-455C-1 in the 455 IF slot. I am confused about which filter switches I need to turn on. Do set the 4, 3 and 1 switches on or just the 3 and 1 switches?

Hi Mike

According to my '450 manual, 2 is 8.83 SSB, 3 is 8.83 CW and 4 is 455 CW.

I\';m actually a little confuse as to what 1 is. I have 1, 2, 3 an 4 all
turned on with the same filter selection as you have there. 73

8984. Re: New to TS-850 and have a question about the filter switch settings

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-05 17:29:49 UTC
From: nz6p_mike
Topic: 8981 Message: 8984

I agree it is very clear in the TS-450 manual. On the TS-450 the two slots for the 8.83 IF are set up so that the ssb filter always goes in one and the cw filter in the other.

But in the TS-850 the instruction manual shows that the ssb filter (1.8kHz) goes in one slot if the narrow cw filter is also being installed in the 8.83 IF and the ssb filter goes in the other slot if the 500Hz cw filter is being installed. The confusion for me comes because the figure in the instruction manual for setting the physical switches on the top if the rig shows the #4 switch is for the CN (narrow)cwfilter and the #3 switch is for the C (500Hz)cw filter. I suspect I am reading too much into into it. I put the three filters in the slots that they were supposed to go, and I should simply turn on the three switches 4, 3 and 1.

Right? Then scrolling thru the 8.83 IF filters from the front panel will give me the 1.8 ssb filter when it displays 2.7k and I will get the 500Hz cw filter when it displays 500. But what am I getting when it displays 270 ???

It 'sounds' more like I am getting the 1.8 when it displays 270. Could it be that the instructions in the manual for placing the ssb filter in a different spot depending on which cw filter is being installed are wrong?

I am baffeled.

If you are getting the 1.8 filter in the 270 spot then that is right at least thats the way mine does it when in SSB Mode when you go into CW mode it will slect the filters for CW and if you have the 500hz filter you wont get any RX in the 270 position just the 500. Hope this helps.

It can be confusing. It's been more than 15 years since I installed filters in my 850. Don't pay any attention to what the display number says, you can put any filter in any slot (same IF of course). For example I have a 240 filter in the "500" slot on my 455 IF. When I bought the rig in 1993 or 4 there was a 1.8 SSB filter in the 8.83 IF "500" slot. Bob WE6C

this must go through an interface device, NOT direct rs232, levels are ttl

is tyour rs232 an actual interface device???

8988. Frequency shifting problem using PSK31 with the TS-850SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-05 19:48:08 UTC
From: professorsolderflux
Topic: 8988 Message: 8988

I have an intermittent problem with frequency drift (or shift) when using the PSK31 mode on my TS-850. I am using HRD 5 beta, and DM780 for rig control and interface. I am also using a RIGblaster Plus and the motherboard card of my 3GHz IBM PC. I am operating in VOX mode (on the RB), letting DM/HRD provide the PTT switching.

I've worked many countries over the last month, but am now plagued with the received signal trace moving position on the waterfall (+20Hz or so) with each RX return. If I TX on the adjusted RX freq, the other party has to chase me with each go-round.

I do not have RIT, or XIT enabled. West Mountain was no help, except to say their interface has no control on frequency tuning (which is correct). I am taking the line-level audio from the ACC 2 jack at the rear into their adapter and then to the PC and rig.

Does this problem sound familiar to anyone?

8989. Re: [TS-850_450_690] Frequency shifting problem using PSK31 with the TS-850SAT

It sounds to me as though you have the Rx AFC enabled, as well as Tx-follows-Rx (or whatever these functions are called in DM780)... If so, disabling either one should bring some stability.

Anyone else have a guess?

Cheers & GL,
Chuck WA3CEJ

I will try to clarify, at least mine works this way. Regardless of mode, any filter spot can be "chosen" in either IF. Naturally if you choose 500hz and trying to listen to SSB, you won't hear much. As far as the switches go, each filter switch must be turned on to activate that filter and the power must be off when turning on the switches. Hope this helps. Bob WE6C

From: professorsolderflux
Topic: 8988 Message: 8991

Yes, I do have AFC enabled. I did this after first encountering the change. Maybe I don't fully understand the AFC concept (the DM780 manual is a little light on details), but I thought it might better track a changing RX freq.--I'll try it without for a while. I'm not aware of the other feature in the DM app, but I'll look.

Thanks for the help, Chuck.

Thanks, all. I have it straight now. I also found an older post from NL7W who wrote:

"As for the lone 2.1 KHz SSB filter in the 8.83 MHz IF, assign it to the 270 Hz slot, dipswitch #4 on. In effect, this will leave the rig's installed 2.7 KHz filter alone, offering you the choice between these two SSB filters by the push of the 8.83 FILTER selection button on the front panel. You'll like the difference the 2.1 KHz makes for you on crowded bands -- slightly narrower, but with steep skirts. Like you may assume, install and assign the Inrad 400 Hz CW filters to the 500 Hz slot in both IFs. ☐ dipswitch
positions 1 and 3 on."

Which is what I did with my filters (although my CW filters are the 500Hz type.) It means that when I see the 8.83 IF display 500, it is the CW 500 Hz filter and when it displays 270 it is the 1.8 SSB filter. A little anti-intuitive but I've got it.

Now for some on the air time....

Hi
Do you have the 'net' or 'afc' buttons pushed in? If so, click them out.
If you have AFC pushed it, it will start searching for another signal to
lock onto. 73

Hi Ron

If you have AFC enabled, and the bandpass wide open, it will start searching
for other signals in the bandpass. As long as it can hear something, it
will try and lock on that station.
73
Tom W7WHY

Yes, I do have AFC enabled. I did this after first encountering the change.
Maybe I don't fully understand the AFC concept (the DM780 manual is a little
light on details), but I thought it might better track a changing RX

Rig is here and is working like a charm thanks to you guys helping me with the cabling ALL I CAN SY IS WOW I CANT BELIEVE THE EXCELLENCE OF THIS RADIO.

Even the original box has not scratches, this rig is truly pristine and MAN WHAT AUDIO I don't have any filters yet just the stock ones and it already sounds better than any rig I have owned, including the FT-1000MP MKV I had not too long ago.

Still putting mine together (it's on a long, long list!) but if it helps, the quality is excellent. (I haven't checked, but there can't be many products on eham with an overall 5/5 rating from 12 reviews.) See also a rather fuzzy 'TS-850 with WINRAD via the LP-PAN' on You Tube.

Hi Bob,

According to http://www.telepostinc.com/LP-PAN.html, "Available for [snip] Kenwood radios with 8.83 MHz IF output jack for SM-220 (TS-850,870,940,950)."

I've used a Heath SB620 'Scanalyzer' with my TS120 & TS130 rigs (same 8.83 MHz IF but, single conversion). With the triple conversion scheme of rigs like the TS850, you can see only as far away from the center frequency that any selectivity in your first IF will allow. If you have a 20KHz wide roofing filter, that's all the bandwidth in which you're going to see any signal(s).

JUST JOINED

If this is everything they say it is, this along with a ts-850sat filtered up with INRAD and modified accordingly, would be better than an ic-756proIII.

Mine was doing the same thing a few years ago. I sent it to Kenwood repair in Lynn Haven, Virginia, and they replaced a "DC to DC converter" and even sent me back the defectice mini board as a trophy!! Only cost $100, and it has worked fine ever since!!

Did you set the bias on the drivers and finals after replacing the parts?

The bias was not reset.Thanks for the help.kh6el

9014. AMP/450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-10 01:54:28 UTC
From: Richard Schmuke
Topic: 9014 Message: 9014

I got my hands on a old SB-230. It has many good parts in it and then the tube is of course is a unobtanium . I am in a process of gutting and re-tubing it like the ZL1ABX amp.

I have a TS-450, It looks like I can use the remote connector pin 2 & 4 to control a small relay to operate the amp. Does anyone know the rating on this relay in the TS-450. It will be used to only to control another 24v relay I will add in the amp.

I am trying to keep away from a foot switch because a foot switch is what I use on my Heil mike

PS: Anybody need a spare block of Beryllium

Take another two wires from the foot switch to the amp and not worry about it, seeing how you are already doing this.

That will work if you have a spare pair of contacts on the footswitch. Otherwise the PTT voltage and the amp voltage probably won't get along together too well...

Right. But, you could use the foot switch to control a DPDT relay which switches the radio and the amp both (if you don't have a cable). I've done that here in an emergency. 73
Tom W7WHY

That is no problem , I did not use the Heil foot switch but made my own and used a micro-switch and a homemade foot pedal. The Heil cost too much and homemade was free. I am cheap. I can just add another switch. It could use a little more resistance on the foot pedal anyway.

Let's see, a switch activating a relay activating more relays activating more relays. You T/R time is probably measured in seconds.

You are right Clif , but the relay in the SB-230 is small and I am planning on replacing it with the next size larger. The T/R and bias is one 3p/dt relay but it is close to the max on the coil load for the 450 so a smaller one in between would reduce the load on the 450. I might go with the foot switch only but I do not think one small relay would add much time delay, the relay is rated at 15msec.

Clif , I must apologize , in checking out coil loads vs load capability of the 450 I crossed watts and ma. The 450 can control the relay I am going to use with no problem.

Let's see, a switch activating a relay activating more relays activating more relays. You T/R time is probably measured in seconds.

Hi Rich,

I have the Heil footswitch, a well-built unit. It has TWO microswitches in it, slightly out of time from each other. The one that toggles first is connected to the amplifier's ANT RELAY input. The second is connected to the rig's PTT input. The concept avoids hot-switching the amplifier.

If you run PTT exclusively, or run VOX (or semi/full break-in on CW) and have an amplifier that switches at least as fast as the rig, it's not an advantage. Currently, I don't run VOX w/ my TS850 because my SB220 still uses the slow OEM relay... for now. I use a homebrew transistorized relay driver (5V/10mA input).

If you're rebuilding your SB230, it might be a good thing to visit Richard Mesaures' (AG6K) website (www.somis.org) where he talks about QSK modifications for amplifiers.

Anything Bob Heil ,K9EID,makes he tries for first class. He is a real nice guy , lives just across the river from me. Any way I was given the amp because the person who bought it off e-bay does not have the time or skill to work on it. He was been after me to work on it for a couple of years, finally he just gave it to me for parts. The tank circuit is fine as is the power transformer so new caps , diodes will be installed. Input and tube will be like the ZL1AXB amp. I have got most part in house now. Now moving the RF deck forward about 2 inches to give room for the glass tube and input coil.

Output/bias relay will be increased in size, soft start tube will be replaced with a relay. Just things to keep a old guy from getting senile.

I use PTT only , my back up rig is a TS-430 and had been exposed to saltwater , the VOX controls on top were corroded.

9027. Is Timewave audio DSP useful for TS-850?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-11 17:08:49 UTC
From: nz6p_mike
Topic: 9027 Message: 9027

I have used both the DSP-9 and the DSP-59+ on my TS-450 and found them very helpful for CW even with 500Hz IF filters. The IF shift would help, but the DSP was better.

Now with the TS-850's IF Slope tuning and my 500Hz filters, I do not see much use for the DSP-59+ on CW. Am I missing something? The reason I ask is the when I got the used rig, the previous owener included the article "TS-850 - 13 years later" which seemed to rave about using the DSP-59+. Am I wrong in assuming that the author was mostly talking about SSB reception?

I am interested in hearing if anyone finds the audio DSP worth while, especially on CW.

That may be the key. I usually operate 40 and 20, although I can work 80 meters. I will give it a try. Thanks.

9030. RFI WITH COMPUTER CONTROL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-14 00:26:59 UTC
From: Bob AD5VJ
Topic: 9030 Message: 9030

I purchased a computer control cable off of eBay
Item number: 290395325359

and it is working fb except when I key at even 100w my rig TS-850SAT jumps out of control. As long as I disconnect the computer control cable it is fine. Happens in cw mode which is the main one I use here.

I have tried a couple of ferrites on the computer control cable at the rig input and it has not helped. Never a problem with this same computer or software in the last 4 years so don't believe it is the computer.

Anyone have this problem who solved it, I don't want to reinvent the wheel on this particular issue. If it was radio or antennas I might be interested, but not computer problems, any help would be appreciated.

Very frustrating to try and work dx while putting your rig back into cw from it jumping to ssb, rtty, ect.

73,
Bob AD5VJ

have you tried repositioning the location of the cable. make sure it does
NOT run parallel to the coax. Have you inquired to the seller, is it
possible it could be a bad unit.

All I could offer, is to send it to someone else to try, to see if they also
have the problem...

are you keying through the interface, or hand mike.. interface could be
wired wrong??? maybe

I just emailed the seller and am awaiting a response I did reposition the cabling, no clue why this is happening, first time ever.

I really like this rig I hope sincerely this is not a weakness of it. Looks like so far after searching the internet it doesn't seem to be.

Except with the Kenwood mc80 mic which I solved that issue of rf feedback with a single ferrite on the cable leading from the mic element to inside the base.

I missed part of your message before I am keying with the hand key in order to take as many variables out as possible. If I unplug the rs232 cable the problem goes away or if I turn power down to 47 watts the problem stops.

I think if you are fighting RF on the mic then your problem is probably not the cable but grounding or antenna/feedline issues. You should not have rf in the shack with proper grounding, and rf on the feedline is remedied from the antenna or feedline, jut ferrite beads on the mic cable.

Just my $.02

9035. TS 450 strange Issue

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-14 04:43:22 UTC
From: Tim
Topic: 9035 Message: 9035

I have a strange problem on my ts450,I can hear usb transmissions in lsb and vise versa.Also will transmit this way if i transmit in lsb people understand me on usb?whats going on here..Radio works fine other than this and yes i have the filter in the 2.4 position..Thanks

The TS-850 is not RS-232. You need a level converter.

I would have to agree with a few of the replys here. First, it sounds like you have a lot of RF in the shack and need to check the grounding. I even grounded the computer. Also, you will need a level converter. Easy to build from online sources.

Just my thoughts...

I have an interface and it has a level converter built into the db9 connector which is all smt type components, I am beginning to wonder if they might be subject to rf levels.

I have never had trouble with any of the rigs before this one, but may very well consider more grounding, I have tried ferrites and they helped the mic rf feedback (mc-80), but the rig now seems to be a problem.

The amp is grounded, I will try the rig next, I may be because all the other rigs had power from the mains and this one is through a power supply so may need a separate ground for the rig, good idea thanks.

I built an interface using MAX232's in DIP cases. I have not had any trouble with computer interface RFI in the ham bands.

I've noticed conputer RFI all over the place when listening in the LOWFER bands (137, 185, 500 kHz) this winter without the computer connected to the rig and it's a little worse with the sound card connected to the rig. So it's difficult to decode WOLF, etc. with the computer on.

But it might be this particular computer (Dell Optiplex GX270). I haven't tried it with a different computer yet.

Hi Zack

I am starting to suspect the smt component level converter.

I may very well just buy a different type or build one for myself from the MAX232 chips as you did.

Please email me off list with any links or information on the one you did, since I know the design works.

I could search it on Google, but may not find the same design that I know you have used and that works - I don't want to reinvent the wheel on this one if at all possible

9042. Re: [TS-850_450_690] Re: RFI WITH COMPUTER CONTROL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-15 04:10:28 UTC
From: Chuck Goelz
Topic: 9030 Message: 9042

Bob,

If you are interested in building your own serial interface, I would like to encourage you... I did -- twice. With great success and little effort. I started with the article written by K6XX on the topic. He describes interfaces from the simplest to the most robust, and explains how the chips in the computer and the radio handle the signals presented to them -- and why a perfect adherence to the RS-232 spec is unnecessary. It's a great article that I got from the files section of the TS-440 yahoo group (I should upload it to this group's files section, too!).

His simplest interface uses a zener diode and a resistor to condition the RS-232 level signal for the radio's TTL level interface... Then he describes more sophisticated methods using opto-isolators...

I decided to start with the simplest form, and add sophistication only as required... Additions were never needed. I'm using the simplest form (diode and resistor) and it is flawless with my TS-440. Then when I got my TS-450SAT, I found that it was still flawless. And after replacing my shack computer, it was still flawless. I just built a second one, so that I can control both the 440 and the 450... Flawless. With my DXLab software, I can even make the 440 automatically follow the 450 when I twist the 450's VFO knob, or press a mode button....

I used a stereo patch cable as a source of dual-shielded cable to carry TD and RD only. I don't even connect RTS and CTS... These Kenwoods don't care about that... I got the 6-pin DIN connectors from either Mouser or Jameco (can't remember at the moment which). They're pretty cheap (as am I!).

As for your RF problem, I'd like to suggest that you look into your station grounding and bonding. By "bonding", I'm referring to the connection of all "grounds" to each other. Your station should have all equipment connected to a common ground connection, and that connection should be connected to the same ground as the electric service equipment. If you have a ground rod (or rods) for your antennas and shack, then it NEEDS to be bonded back to the electric service ground as well... (I've heard some use the term "Equi-Potential-Plane"). The National Electric Code (from which all local building codes are derived) absolutely requires this! The NEC requirement for the size of the bonding conductor is a function of the size (or "ampacity") of the electric service. E.g., for 200 Amp service, a #4 AWG conductor is required... BTW, the ARRL handbook was corrected on this issue some years ago. Old handbooks ('60s, '70s, and at least into the '80s) used to show independent grounds... Believe me when I tell you that multiple grounds that are not bonded are a serious issue in terms of personal safety as well as equipment damage.

One other note -- I don't rely on the power cord for grounding my computer. I use a ground connection at one of the screws securing the power supply to the tower chassis connected to the station ground bus to ensure that the computer ground is the same as the radio ground...

Please feel free to ask for help either on or off list if you wish.

Cheers, and GL,
Chuck WA3CEJ

9043. New Upload to Files Section

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-15 06:31:20 UTC
From: WA3CEJ
Topic: 9043 Message: 9043

I have just uploaded a file to the FILES section, pctsinfc.pdf. It was written by K6XX and it is a great tool for those who want to build their own level converter and interface cable for computer control (or who just want to understand what this interface does).

It provides a great explanation of why the chips don't really need RS-232 compliant levels to receive data from the radio, and how the RS-232 signals from the computer can be easily conditioned to the TTL levels for the radio with just a resistor and a diode. But he also provides detailed descriptions of more robust interface designs using opto-isolators.

I can attest to the validity of his presentation. I first built the simplest interface with just a resistor and a diode, and it worked so well as an experiment that I finalized the interface using a stereo patch cable to provide a pair of nice flexible shielded lines between the TS-440SAT and the computer (with a 6-PIN DIN and a DB-9 on either end, diode & resistor in the DB-9 shell). I used only RD & TD signals (pins 2 & 3) and ground. I did not not even connect RTS or CTS. It has worked flawlessly for almost a year now.

Then I bought a TS-450... This interface (as well as the 13-pin DIN for AFSK audio) was 100% plug compatible with the 450. Still, flawless operation. Since then I built a second interface cable customized to connect to the second serial port on my motherboard (10-pin header). Now both the TS-440SAT and the TS-450SAT are controlled flawlessly. And, using DXLab Commander software, I can make the 440 do whatever the 450 does -- change freq on the 450, the 440 changes to the same freq. Same with modes... Or they can be independent...

I do suggest grounding your computer chassis to your station ground. I never operated without that ground, so I don't know what would happen without it, but with serial control interfaces, and soundcard interfaces, it just makes sense to ensure a common ground.

This file was copied without anyone's permission from the TS-440 yahoo group's FILES section. It can also be found by Googling "K6XX interface"

If just one person finds this useful it will have been worth it...

Chuck WA3CEJ

From: Chuck Goelz
Topic: 9030 Message: 9046

Hi Bob,

Glad you got the file...

As for a grounding presentation, I did find this one recently--

http://www.rars.org/documents/Station%20Grounding.ppt

It covers the topics, and has some photos, but seems to lack the "Speaker's Notes". At the end references are provided that you may wish to explore...

The bottom line is bring everything to the same potential through proper bonding of elements of the ground system. I would describe that with 3 statements: 1) Provide a common point in the shack to connect all equipment to (I use a ground-bus-bar as is found in a circuit breaker panel), 2) Bond that shack ground point to the electrical service ground point (the ground rod connected to your breaker panel), and 3) Bond the antenna/tower ground to the electrical service ground.

The size of the ground wire bonding your shack to the service entrance is up to you, but I wouldn't want it to be smaller than #8 (#6 or #4 would be better). But, the antenna ground, assuming that you have one or more ground electrodes (rods or buried base of support) becomes an issue with the National Electric Code and your local building codes because it is an extension of the house's ground system, so the bond wire needs to be sized in accordance with the capacity of your service (e.g. I believe that 200 Amp service requires a #4 conductor).

Hope that helps,
Chuck WA3CEJ

[Non-text portions of this message have been removed]

9047. Re: [TS-850_450_690] Re: RFI WITH COMPUTER CONTROL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-15 20:53:32 UTC
From: Chuck Goelz
Topic: 9030 Message: 9047

Bob,

The file is there in the FILES section of this group now (well, at least I can see it). Look a bit more than half way down the page for the file "pctsinfc.pdf" (the description starts with "K6XX "...).

If you have any problems getting it, I can email it directly to you...

Cheers,
Chuck WA3CEJ

Hi Chuck

Thanks for writing. Some really good ideas here. Please let me know when you get the file uploaded, I would very much be interested in reading it.

Bob AD5VJ

> If you are interested in building your own serial interface, I would like to encourage you... I did -- twice. With great success and little effort. I started with the article written by K6XX on the topic. He describes interfaces from the simplest to the most robust, and explains how the chips in the computer and the radio handle the signals presented to them -- and why a perfect adherence to the RS-232 spec is unnecessary. It's a great article that I got from the files section of the TS-440 yahoo group (I should upload it to this group's files section, too!).

9049. TS-850SAT receiver muting

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-16 05:18:35 UTC
From: w8nf
Topic: 9049 Message: 9049

I tend to use three (3) TS-850SAT radios for some of my goofy adventures. One as a transceiver, the other two either on separate antennas or tuned just to the upper and lower side of my TX freq.

For most of my uses, when I transmit on the one rig, I want all three receivers to mute.

Old-fashioned receivers had a mute line - open it up and the receiver goes deaf. I don't see a pinout for any of the rear panel connectors for this feature. Must I put the two "receivers" into transmit mode to mute the receivers?

TNX,

Dave W8NF

9050. TS-690 Issues-Suggestions

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-16 05:30:23 UTC
From: kd8geh
Topic: 9050 Message: 9050

Hi All,

New to the group, greetings all!

I have a TS-690 with some issues. This rig was owned by maybe a cber. Power is turned up. Been in storage for 5-10 years. Here's the story:
First run up:

1)Display seems dim compared to my 430 and 950
2)S meter appears to read low compared to my other rigs by a few db. Seem sensitive though, can hear all stations.
3)All bands but 80 & 160 work well with good reports. On 80 & 160 I see swr moving and possibly finals folding back due to the swr issue I believe.

Second run, I read threads and reseated all the connectors, retightened the board ground screws etc.
1)Display still dim.
2)S meter still low.
3)Now 80 seems to be ok on xmit. 160 still has the swr issue.
Radio is very clean, pots look to be undisturbed. Readng, maybe I should look at the final traces or possibly a processor reset. Going slow at this point.

Any suggestions appreciated.

Thanks for the help and 73.
Dave KD8GEH

> 1)Display still dim.

check wiring voltage, if correct then maybe bulbs were replaced with
incorrect ma rating...

> 2)S meter still low.

this is relative anyway, every dx station gives a 59 report whether you
really are anyway..

> 3)Now 80 seems to be ok on xmit. 160 still has the swr issue.
> Radio is very clean, pots look to be undisturbed. Readng, maybe I should
> look at the final traces or possibly a processor reset. Going slow at this

if finals are ok on other bands, they are NOT at fault here. check on a
dummy load???? maybe antenna just isnt resonant, and the radio is trying to
tell you that

Thanks so much Dave!

It's not the antenna, some other gremlin. I forgot to mention the audio is pinched..tinny. Was like that on 80 before the reseat of connectors.

I have a tuner and verified with 2 other rigs on my loop and dipole to be sure I was reasonent.

I will check the voltage to the bulbs.

Take care,

73, Dave KD8GEH

9053. Re: [TS-850_450_690]Rig Choices...

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-17 05:14:00 UTC
From: Chuck Goelz
Topic: 9050 Message: 9053

I have 3 rigs, and need to pare that down a bit -- maybe to 1, maybe to 2. I'm retired, so there is little money in budget to allocate to the shack...

I have a pair of Twins (T-599D, R-599D, S-599) is really awesome condition. The R-599D has the 6m and the 2m convertors installed. They work flawlessly. The only unfortunate thing about this rig is that the previous owner wanted to make it work with a digital display (DG-5?) and added 3 RCA phono jacks to the rear panel of the R-599D. I have removed that mod, but the damage to the rear panel is permanent. I bought these in 1986 (I was certainly influenced by the fact that I saw the Twins for the first time when TDY in Japan in 1970, in a store front in Tokyo -- Thought they were one on the nicest rigs I ever saw. The T-599D still has the S2001A finals (assumed to be original) and they show no signs of needing replacement! I.E., other than the RCA jacks on the Rx, this rig is CLEAN.

I also have a nice TS-440SAT. It has the YK-88C and YK-88SN (500 Hz CW and 1.8 KHz SSB) filters installed. It has been reliable, and everything works. There are a few cosmetic issues, but nothing that influences it's operation... I've been using it for a year or so on PSK31, SSB, and CW, so I know that all functions work as expected.

My latest acquisition was a TS-450SAT, to which I have added a YK-455c-1 500Hz CW filter (still searching for bargains on YK-88C-1 and YK-88SN-1). I really like this rig for CW -- the QSK is the best I've seen since the old seperate Tx/Rx rigs that I used to own back in the '60s, with a Handbook design home built "electronic T/R switch". Makes me wish I could afford to add a DSP-100 to it (they get a lot of $$$ for those)!! Also, the 450 is flawless both functionally and cosmetically, except for 2 "blemishes" (can't even see that there was "damage" to cause this) on the front panel.

I'd like to hear what others think about the potential to sell 2 of the 3 rigs, and buy one better than any that I have... What would you think I should sell, and what would you think I should buy (with no additional outlay of $$$). I'd also be open to selling all 3, but a bit reluctant.

My thoughts go like this: The Twins are awesome Hybrid technology (think I'll post this to the 520 group as well), and in fantastic shape. But their value has probably peaked... So, money-wise, might be a good time to sell. The 440 is a solid performer, and extremely easy to work on and get parts for, and find expertise for troubleshooting... But it doesn't perform as well as the 450 (I think!). The 450, as well as it performs, is more problematic if it fails -- seems to be less expertise available, and those DDS chips... OHHH those DDS chips... Scares me!!!

So, If I decide to sell X and Y, what do you think I should buy? A TS-850? A 950? An Icom 746 or 756? I like rigs with lots o' knobs... The more knobs the better!! So tell me what you think -- I'm listening!

Cheers,
Chuck WA3CEJ

9054. TS850 PLL problem?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-17 13:16:26 UTC
From: rovntoma
Topic: 9054 Message: 9054

Hallo,my old TS850 (YM6631)has problem.A few moth ago starting drift freguency.(around 100khz)Now,after 30-45min,has only dots on display.
I realigment voltages according service manual.I think,that the problem is VCO2.Manual says +5V on TP2.But after a few minutes SSB voices are cripsy with distortion.I try 6V and all was good,but after 1 hour turn off/on cycle audio was distorted.Now I set +4V,and all is good(still). First time I had idea,that YM6631 are defective.(smd caps on DDS carrier board was changed to ELNA).Where can be problem?

Most likely the cap in VCO-2 is flaky. Just replace it with a 10pf ceramic and set it for 5v.

9058. Re: [TS-850_450_690]Rig Choices...

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-18 02:13:48 UTC
From: kc5cqw
Topic: 9050 Message: 9058

Chuck,

Why sell any of them?

I have a Yaesu FTdx-401b tube rig for those days when I want to admire tube glow and smell the dust burning off the tops of them.
An Elecraft K2 (fully loaded QRP model) for going outside, in the park or whatever. I also just like to admire the fact that I built it myself one piece at a time.
My truck has a Yaesu FT-857D for 40m-70cm all mode fun going to and from work.
Finally, my TS-450S is the work horse at my QTH. I mostly use this one on the digital modes with a Tigertronics Signalink USB+ and my Powermac G5 computer.

My point is, you seem to have a rig for the major occasions.
A really nice tube (hybrid) set for those days you just need the glow.
Your TS-440 makes a fine backup rig and fills the need for a low maintenance work horse.
The TS-450 can be your rig for experimenting. I have added all kinds of modifications and enhancements to my 450 and every one makes it that much better.

I really don't believe that selling your radios will get you enough cash for a radio that will knock your socks off. For this, you will need an Elecraft K3 or a Flex-3000 (or 5000). Both of these start around the $1500 price point and go up from there. Everything else out there at a lower price is mediocre at best when it comes to RF performance. Besides, the TS-450 will hold its own against these newer mid-class rigs any day.

The Flex radios require a PC but, bells and whistles are plenty! New firmware updates always yield a new set of features to get used to and play with.
Elecraft makes very serious high performance radios but, they can suck your wallet dry.
Alas, you get what you pay for and it won't disappoint you.
Both companies are in the USA and "own" any japanese rig you can throw at them, period.

If you must get a new radio for the bells and whistles, service after the sell and reliability, go for the K3 and keep the 450 for backup. If you cant justify the cost or will miss the other radios (you will) keep what you have! Spend some good cash on improving your antenna system first then enhancing your radio next. You already have good radios that would make many proud to own.

Sure, I would love to own a new GMC king cab diesel 4X4 but my little Nissan "rice burner" does the same job of getting me to work reliably and cost allot less.

Ultimately, only you can decide what would be best for your needs.

Good luck and 73,
Damon

Topic: 9050 Message: 9059

Damon,

Thanks for your inputs! I do appreciate your thoughts on the subject, and I'm glad that you think that I already have some pretty good stuff! I seem to be surrounded by people who have the latest and greatest, and sometimes feel that I'm living in the dark ages (in spite of the computer control, PSK, automatic QSY to spots, mouse-click logging, etc - though I still do CW manually!).

I have seen and heard a lot about the the TS-850 and 950, so I was thinking that selling 2 of the 3 that I have, I might be able to move up to something with dual-slope bandpass tuning... Yeah, the K3 sounds real nice, too, but a bit out of my price range as you pointed out!!

As for my issues with reliability and the unobtanium DDS chips, I do keep the rig powered on 24/7 (as are my 4 computers and a lot of other things), which, based on my experience, will extend their life substantially...

Again, thanks for the vote of confidence on my existing collection of gear! And I encourage more input from others on the subject...

Cheers to all,
Chuck WA3CEJ

Subject: Re: [TS-850_450_690]Rig Choices...

Chuck,

Why sell any of them?

I have a Yaesu FTdx-401b tube rig for those days when I want to admire tube glow and smell the dust burning off the tops of them.
An Elecraft K2 (fully loaded QRP model) for going outside, in the park or whatever. I also just like to admire the fact that I built it myself one piece at a time.
My truck has a Yaesu FT-857D for 40m-70cm all mode fun going to and from work.
Finally, my TS-450S is the work horse at my QTH. I mostly use this one on the digital modes with a Tigertronics Signalink USB+ and my Powermac G5 computer.

My point is, you seem to have a rig for the major occasions.
A really nice tube (hybrid) set for those days you just need the glow.
Your TS-440 makes a fine backup rig and fills the need for a low maintenance work horse.
The TS-450 can be your rig for experimenting. I have added all kinds of modifications and enhancements to my 450 and every one makes it that much better.

I really don't believe that selling your radios will get you enough cash for a radio that will knock your socks off. For this, you will need an Elecraft K3 or a Flex-3000 (or 5000). Both of these start around the $1500 price point and go up from there. Everything else out there at a lower price is mediocre at best when it comes to RF performance. Besides, the TS-450 will hold its own against these newer mid-class rigs any day.

The Flex radios require a PC but, bells and whistles are plenty! New firmware updates always yield a new set of features to get used to and play with.
Elecraft makes very serious high performance radios but, they can suck your wallet dry. Alas, you get what you pay for and it won't disappoint you.
Both companies are in the USA and "own" any japanese rig you can throw at them, period.

If you must get a new radio for the bells and whistles, service after the sell and reliability, go for the K3 and keep the 450 for backup. If you cant justify the cost or will miss the other radios (you will) keep what you have! Spend some good cash on improving your antenna system first then enhancing your radio next. You already have good radios that would make many proud to own.

Sure, I would love to own a new GMC king cab diesel 4X4 but my little Nissan "rice burner" does the same job of getting me to work reliably and cost allot less.

Ultimately, only you can decide what would be best for your needs.

Good luck and 73,
Damon

>
> I have 3 rigs, and need to pare that down a bit -- maybe to 1, maybe to 2. I'm retired, so there is little money in budget to allocate to the shack...
>
> I have a pair of Twins (T-599D, R-599D, S-599) is really awesome condition. The R-599D has the 6m and the 2m convertors installed. They work flawlessly. The only unfortunate thing about this rig is that the previous owner wanted to make it work with a digital display (DG-5?) and added 3 RCA phono jacks to the rear panel of the R-599D. I have removed that mod, but the damage to the rear panel is permanent. I bought these in 1986 (I was certainly influenced by the fact that I saw the Twins for the first time when TDY in Japan in 1970, in a store front in Tokyo -- Thought they were one on the nicest rigs I ever saw. The T-599D still has the S2001A finals (assumed to be original) and they show no signs of needing replacement! I.E., other than the RCA jacks on the Rx, this rig is CLEAN.
>
> I also have a nice TS-440SAT. It has the YK-88C and YK-88SN (500 Hz CW and 1.8 KHz SSB) filters installed. It has been reliable, and everything works. There are a few cosmetic issues, but nothing that influences it's operation... I've been using it for a year or so on PSK31, SSB, and CW, so I know that all functions work as expected.
>
> My latest acquisition was a TS-450SAT, to which I have added a YK-455c-1 500Hz CW filter (still searching for bargains on YK-88C-1 and YK-88SN-1). I really like this rig for CW -- the QSK is the best I've seen since the old seperate Tx/Rx rigs that I used to own back in the '60s, with a Handbook design home built "electronic T/R switch". Makes me wish I could afford to add a DSP-100 to it (they get a lot of $$$ for those)!! Also, the 450 is flawless both functionally and cosmetically, except for 2 "blemishes" (can't even see that there was "damage" to cause this) on the front panel.

>
> I'd like to hear what others think about the potential to sell 2 of the 3 rigs, and buy one better than any that I have... What would you think I should sell, and what would you think I should buy (with no additional outlay of $$$). I'd also be open to selling all 3, but a bit reluctant.
>
> My thoughts go like this: The Twins are awesome Hybrid technology (think I'll post this to the 520 group as well), and in fantastic shape. But their value has probably peaked... So, money-wise, might be a good time to sell. The 440 is a solid performer, and extremely easy to work on and get parts for, and find expertise for troubleshooting... But it doesn't perform as well as the 450 (I think!). The 450, as well as it performs, is more problematic if it fails -- seems to be less expertise available, and those DDS chips... OHHH those DDS chips... Scares me!!!
>
> So, If I decide to sell X and Y, what do you think I should buy? A TS-850? A 950? An Icom 746 or 756? I like rigs with lots o' knobs... The more knobs the better!! So tell me what you think -- I'm listening!

I replaced cap 22m/16v by Sanyo(OSCON).It was leaky.Also voltage regulator 78L08 was bad.I replaced it with 78L12 and set +5V.The voltage is stable and all is good.Still I am testing it.

All wrong.

Replace the 7812 with a 7808 like it was designed.

Replace the TRIMMER CAP in the VCO.

Clif

My name is Ian, I'm almost 47 & live in the south west UK, I have had my 850 for almost a year but it has developed a problem, If I key up on SSB with processing on the radio transmits & horid noise with no audio but is fine with processing off. Anyone come across this before?

Many thanks
Ian M6KDX

you dont say what microphone, or what devices may be attached as well

you may be overdriving the radio

Hello everybody. I do not know if this is the right plase to forward this question.I have a TS 570swhich does not have audio output either through thre built-in speaker ,external speaker nor through the head phone. I know it receives signal as the LCD S meter indicates so. Any suggestion is appreciated. Thank you and 73

Is the s meter flucuating, or staying at a steady reading.... maybe rf
gain turned down, which causes leds to rise, and could be above reception
level.

check to see if rf is fully clockwise

Well I had a problem like that but it was an older rig (TS-430) that had
been on a boat and exposed to salt water mist. The head phone jack was
corroded and when the plug as in there was no good contact and when the plug
was removed the other contacts did not reconnect. Your rig is too new to
have this but check all wires going to any speaker or phone jack for any
signal with a DVM.

Temperature in the room is constant between 20-22C.I am looking for something like this:http://tk5ep.free.fr/tech/ts850/tcxo/en/tcxo_g.php
But I dont know,when this help me.
Tom

I just fixed mine for that same reason. I replaced the 51 and 150 ohm suface mount on the backside of the rf board.

more info if needed.... also check q49 on that board

Jim,

If someone (such as Clif) knows better, please correct me. Not knowing specifcally what these resistors are on the DC-DC Converter module, I did some searching. I found a reference to ALC pumping here: http://www.g4ifb.com/html/ts850_mod.html#ALC. It appears they are R2 & R3 on the DC-DC converter board. The parts list in the service manual (page 87) says the original parts are pn RK73FB2AXXXJ, where XXX is the value (223 = 22K). These are SMD parts: package: 0805 (0.08" x 0.05"), tolerance: +/- 5%.

Radio Shack does not stock any SMD resistors, and 20K isn't much different from the originalo 22K. You can buy 18K/5%/0805 resistors from Mouser (www.mouser.com)...

Mouser Part #: 660-RK73B2ATTD183J
Manufacturer Part #: RK73B2ATTD183J
Manufacturer: KOA Speer
Description: Thick Film Resistors 1/8watts 18Kohms 5%
Each: $0.06 (qty = 1 - 100)

Hi Jim, I have a DC/DC converter board which i have changed the resistors on (R2 & R3) both to 18k if you want i will post pics on the photo section of the site to show you, i dont mind sending you the whole board complete if it will help,
let me know.
John.

Today I tried another 20mhz crystal from network card.The drift was 250hz from cold start.After 30 minutes the frequency was good and stable.But 250hz past 30min is horrible.Original crystal had 100-120hz.A new crystal can reduce drift?Crystal heater will be good choice,or VCO has another problem?
PS:I prefer SSB only on higher bands.
Thanks for any answer.
Tom

Might be worth checking the decoupling caps as well around the 7808 and any other regulator. I had a TS-430S that bounced around and made funny noise when switching on for a few seconds. I fitted low ESR ones and everything was FB after that. The original electrolytics had dried out from 1uF down to virtually o/c.

Thanks for answer.I will try change 7808 regulator.Caps around was checked and changed.

You are asking it to do something it was not designed to do. If your application requires more stability you will need the TCXO.

The spec's are +/- 10 ppm. On 20M (14 mhZ) that is +/-140 hz. Your radio is within spec at 120Hz drift.

Clif

Before ts850 I had "hot" ts450.I think very similar radios.This was made in 1995 and was quite stable.Drifted 20-30hz max.I upgraded to 850 (1992)and drift is noticeable stronger.

Might I ask how you are measuring this drift?

Clif

Do you mean WWV, some local broadcast station, or another ham?

Do you KNOW his frequency is stable?

The TS-850 manual description of the master oscillator calibration procedure is pretty clear. Have you tried using its measurement technique as recommended, using a SWBC or standard frequency station?

Dan AA3LS

9091. RE: [TS-850_450_690] Re: RFI WITH COMPUTER CONTROL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 02:22:09 UTC
From: Bob AD5VJ
Topic: 9030 Message: 9091

Wanted everyone to know:

I finally resolved the RFI issue with the 850sat.

I had to end up grounding the computer to the same ground as all the other equipment. After a generous ferrite treatment which resolved nothing but the interference to my keyboard, I now have a final solution and am active again on cw at full power out along with rtty and psk.

Thanks to everyone for the help and the file upload, that file helped me get my thinking on track and once I had time to implement it methodically I was able to fix the issue.

Bob AD5VJ

Topic: 9030 Message: 9092

Bob,

Great!! Glad to hear that. It feels good to work through the problem and successfully implement a resolution, doesn't it?

Time for some operating now!

Cheers,

Chuck WA3CEJ

Subject: RE: [TS-850_450_690] Re: RFI WITH COMPUTER CONTROL

Wanted everyone to know:

I finally resolved the RFI issue with the 850sat.

I had to end up grounding the computer to the same ground as all the other equipment. After a generous ferrite treatment which resolved nothing but the interference to my keyboard, I now have a final solution and am active again on cw at full power out along with rtty and psk.

Thanks to everyone for the help and the file upload, that file helped me get my thinking on track and once I had time to implement it methodically I was able to fix the issue.

9094. Re: TS850 PLL problem?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 05:55:25 UTC
From: rovntoma
Topic: 9054 Message: 9094

I tested it with another ham (novice)IC7400+txco.We tested 10m only (his antenna system)His radio was warm (over hour),my from cold start was stable after 30min talking with him.It "walk" +120hz on 10m band.Maybe on other bands drift is not so big.(not tested)I think it depends on temperature in TS850.Room temp is stable.21-22C.
1.PLL setting was set according manual.5V for VCO2(30mhz) and 2,3V (21,5mhz)Trim cap was replaced,because dots on display was present.
2.All elyts on PLL board was replaced.(oscon near 7809 was leaky)
3.Another used 20mhz xtals was tested with even higher drift.
4.Compared to previous ts450 drift is higher on 10m.
5.I have idea buy cheap crystal heater from Kuhne el.Its hold xtal
at 40C temp.
6.My TS850 was many years hardly used with previous owner (silent key)

9095. going mad with ts430 pa

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 12:26:51 UTC
From: Andy G3UEQ
Topic: 9095 Message: 9095

Hi
For the first time ever after repairing many TS-430s over the years, I have one where the PA pre-drivers have failed due to bias regulator 2SD-880Y going s/c. The original 2SC2509's are like hens teeth, so checked out the 2SC1969. Data sheets for both give pin 1 base, 2 collector and 3 emitter. However when I dismantled PA and removed the 2 drivers Q2 and Q3, I was surprised to find the centre pins earthed (collector) and bolted straight on to the heat sink.
The markings on the 2SC2509's have FP written on them, some people say isolated tab but I think this just stands for Flate plate.
Question: Were the 2SC509's for the 430 made with Emitter in the middle pin and tab, this would make sense. If I fit the 2SC1969's I am going to have to fit isolating washer and swap the connections. This is very strange.
Andy G3UEQ

9096. Re: [TS-850_450_690] going mad with ts430 pa

Topic: 9095 Message: 9096

I repaired a similar radio for someone about a year ago. Here's a message I sent to this group on May 12, 2009:

"For the info of all on this group, I replaced the 2SC2509 drivers in the amp module of a TS-430 with 2SC1945 transistors. The same drivers are used in the TS-850S. These have about the same specs as the 2509's and the correct pinout, i.e. BEC when looking from left to right on the TO-220 package. The case is the emitter.

The 2SC1945 seems to be an adequate substitute for the 2SC2509. They are about $8 apiece from RF Parts.

Maybe I should put a note in the Files section?

73, Zack W9SZ"

I guess I never put the message in the Files section.
:-(

Bob, Did you ground the PC on the case or did you have to get inside and ground there?

Wanted everyone to know:

I finally resolved the RFI issue with the 850sat.

I had to end up grounding the computer to the same ground as all the other
equipment. After a generous ferrite treatment which resolved nothing but the
interference to my keyboard, I now have a final solution and am active again
on cw at full power out along with rtty and psk.

Thanks to everyone for the help and the file upload, that file helped me get
my thinking on track and once I had time to implement it methodically I was
able to fix the issue.

9098. RE: [TS-850_450_690] Re: RFI WITH COMPUTER CONTROL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 15:00:13 UTC
From: Bob AD5VJ
Topic: 9030 Message: 9098

This is going to be an unbelievable answer hihi

I took as a test a 6 inch test lead and with the alligator clips on each end simply clipped the test lead to the chassis on the back of the computer and then to the ground lead on the amp and it immediately stopped all the interference. I know this is unacceptable procedure but hey it worked.

9099. RE: [TS-850_450_690] Re: RFI WITH COMPUTER CONTROL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 15:18:40 UTC
From: Bob Naylor
Topic: 9030 Message: 9099

It worked so that's all that matters. I used to do drivability on corvettes and you wouldn't believe how many problems that were cured by repairing grounds! I know this wasn't a repair but it obviously was a needed ground. Hope to work you on 40cw someday.

9100. New file uploaded to TS-850_450_690

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 15:39:59 UTC
From: TS-850_450_690@yahoogroups.com
Topic: 421 Message: 9100

Hello,

This email message is a notification to let you know that
a file has been uploaded to the Files area of the TS-850_450_690
group.

File : /2SC2509_replacement.pdf
Uploaded by : w9sz <w9sz.zack@...>
Description : 2SC2509 replacement in amp modules TS-430, 440, 850 etc.

You can access this file at the URL:
http://groups.yahoo.com/group/TS-850_450_690/files/2SC2509_replacement.pdf

To learn more about file sharing for your group, please visit:
http://help.yahoo.com/l/us/yahoo/groups/original/members/forms/general.htmlfiles

Regards,

w9sz <w9sz.zack@...>

9101. Re: [TS-850_450_690] going mad with ts430 pa

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 15:42:52 UTC
From: Zack Widup
Topic: 9095 Message: 9101

I just uploaded a file to the group's Files section on the substitute
transistor for the 2SC2509.

9102. Strange behaviour on TS850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-26 18:18:26 UTC
From: Patrick Egloff
Topic: 9102 Message: 9102

Hi all,

This afternoon, i had a strange behaviour on one of my TS850s...
The RX sounded like it was a bit deaf.... the RX audio level went down.
The VOL control did not work as usual. At minimum i still had some audio.

The beep when key were pressed was much higher than usualy.

I finaly tried a RESET which worked but did not bring anything except
that i had a noise coming out of the speaker, which faded out after a
few seconds.

Later in the afternoon, everything came back to life...

Any guess ?

73, Patrick

Zack
Very many thanks, just found two in the UK for the same price, funny how the data sheet for the 2SC2509 shows ebc.

9106. Switching diodes in TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-03-27 21:34:44 UTC
From: Ole Nykjær
Topic: 9106 Message: 9106

Hi

I need to replace some of the switching diodes in my TS-850 (blew some up around the RF-unit BPF's while testing a newly acuired, but old SB-200, which "backfired").

Can anybody help with data on RLS135 and MI204? - so I can find substitutes. Guess a 1N4148 will work, but there are surely better candidates.

73
Ole OZ2OE

Hi

my TS-850 have no output on 20 to 10 meter.. max 45 w on 20m..

It gives 100 watt ok for 160 80 60 40 30 meter.

anyone have experienced this?

Hi, I had similar problems with an 850,on 20mts through to 10mts the output power would decrease and would be no output on 10mts, I checked the the voltages on IC1(BCD DECIMAL DECODER) on the RF UNIT and all was not the same on the service manual i changed the IC and now the output power is 100% on all bands, i must say a big thanks to Cliff@avvid for his expertise and guidence to resolving this problem.

Topic: 9106 Message: 9114

Hi all

I must say I had my doubts about my new to me TS-850SAT when I first got it in the shack. I said: "Too small, no filters, no dual watch, no scope, no roofing filter, etc", I said to myself: "I don't know how they ever called this a "contest radio".

Well, I just finished CQWW WPX Contest single operator all bands.
(I had to know abt the rig)
Total: 1059 Prefixes = 514 Total Score = 1,318,410

My first EVER - over 1 million points out of all the rigs I have owned- using this rig and it performed flawlessly and was effortless and was untiring to use.

I would recommend this radio to anyone for any Ham Adventure.

I thought about selling this one BUT NOW:
I am going to get two and gang them together.

Bob AD5VJ

Aloha Bob,
First of all thanks for the contact and multi you gave me on 20. I have been using my 850 for over 5 years and about 20 or so contests and the only thing I have had a problem with has been the DC/DC converter board. I have installed the Inrad Roofing filter mod and it does make a difference on a crowded band along with the 2.1 Khz Inrad filters in both IF's. I worked as a Single-OP Assist. on 20 Meters and established a new record for both Oceanina & Hawaii in that catagory :-).

Band QSOs Pts WPX
14 400 1160 244
14 509 1487 230
Total 909 2647 474
Score: 1,254,678
I ran out of people I have not worked on 20 about 1 and a half hours before the end. I also got 2 full nights of sleep too hi hi.

Enjoy the Workhorse/Great Radio that is the TS-850S.

Roland AH6RR

Is the s meter flucuating, or staying at a steady reading.... maybe rf gain turned down, which causes leds to rise, and could be above reception level.

check to see if rf is fully clockwise

I've been meaning to ask this - does the roofing filter reduce the quality
of the audio of broadcast stations?

One thing I've liked about the TS-850 is the superb audio quality of AM
broadcast BCB and shortwave stations in the 6 and 12 kHz positions.

It kills it. The stock roofing filter (yes it has one) is 20 KHz wide. The Inrad replacement is 4-6 KHz per their ad and is a peak, not flat-topped. Go to their website and look at the ad.

OK thanks Clif. That was what I've been afraid of.

I've found the TS-850 to be an excellent contesting radio with the stock roofing filter in it anyway. Since I do a lot of receiving in the whole spectrum it covers, I think I won't get the Inrad roofing filter mod. I did the mod to remove the broadcast band attenuator when I first got the radio and have had no problems with overloading from BCB stations.

Hi Roland

Thanks for the reply and the contact. I was really surprised at the performance I had an FT-100MP MKV and thought it was good until I used the 850sat in this contest.

I am just glad people have thought of it as an old antiquated radio, as a result, the prices are well within having two of them which with the performance of this radio after strapping them together I believe will put me in the FT1000D category or better. I am really excited

I've thought of that!

They also make excellent IF rigs for VHF. A few years ago someone on eHam had two 850's for sale that he had modified. He removed the amp stage and heatsink from each and installed a transverter in the space to make them into 50 and 144 MHz radios. I think he only wanted $650 for each. I should've bought them.

The add-on roofing filter will also prevent using the IF output port to a wide-band I/Q device such as PL-Pan or feeding the IF to a wide-band SDR...73...Jordan...

Tell me something abt the LP if you get the narrow filters for 455k for cw
does it only show the portion of the band you have filtered out or does it
show what the 8 MHz IF is filtered for?

I have checked the squelsh and all the knobs, but nothing seems to work and
the signal meter fluctuates. I am at a lost.

Is the s meter flucuating, or staying at a steady reading.... maybe rf
gain turned down, which causes leds to rise, and could be above reception
level.

check to see if rf is fully clockwise

Wow that's better than I thought so I can open the 8 mhz IF and see 8mhz of band while on the LP while filtering the 455 for 1.8 or 250 and hearing a much smaller portion of the band.

Now that is cool

Actually, when I connected the IF output from my 850s to my Flex-5000A tuned to 8.830Mhz, I saw a balanced display with good sensitivity across the 192Khz passband, but there was some obvious ripple due to impedance problems with the Flex RF input...There is no RF filtering outside of the ham bands with the Flex, so the input impedance varies widely from 50ohms....73...Jordan....

Topic: 9106 Message: 9134

I just noticed an swr problem that seems to have developed on 15 meters on any antenna I put the rig on if it is on 15. That really scared me so, I hooked the rig up to a dummy load just now and it is just fine so it isn't the rig.

I then remembered that the swr on the other antennas on 15 wasn't good anyway only on the tribander Hornet beam. So the beam must have developed a problem using the amp during the contest and I didn't notice it until now.

Well, the good news is I have a TH-6DX waiting to go up to replace it anyway. Now if I can only find some help around the Fort Worth area to help me get the TH-6DX in the air I am good to go.

For everyone's enjoyment, I just added a GIF to the '850 Filters' folder in the Files section. It shows the difference in response between the stock filter and the Inrad unit.

73,
Bryan WA7PRC

Clif wrote:
>
> It kills it. The stock roofing filter (yes it has one) is 20 KHz wide. The Inrad replacement is 4-6 KHz per their ad and is a peak, not flat-topped. Go to their website and look at the ad.

Tony,

Don't bother sending the unwanted radios to Tom... Because I'll even pay the shipping to help you get rid of those old things that you keep tripping over... Because I am THAT generous!

Cheers,
Chuck WA3CEJ

There is nothing in the drawing telling which is which filter but I am
assuming that the more narrow skirted one is the INRAD.

9146. TS850 Panel Buttons Not Working

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-02 04:33:00 UTC
From: va3jff
Topic: 9146 Message: 9146

Hi All.

I've been using a 2nd hand TS850 for a little over a year. I changed the caps on the carrier board last month, and all was working well. I planned to change the caps on DC-DC board to try to improve on an intermittent power fluxuation.

Now today, when I powered up the rig the buttons on the front panel are not all working. Power, Dim, REC/SEND, THRU/AUTO, AT tune, RIT, XIT, NOTCH and METER all work. As does the mode selections. The numeric keypad seems to work ok too, but the ENT and CLR do not. The memory buttons do not work. The band selection buttons do not work, and neither does the VFO selection or filter seletions.

It also doesn't allow for any of those functions using the computer control software any longer. (HRD with G4ZLP cabling).

Any suggestions on where to start to look? I've checked the ribbon cables and all seem to be seated properly. Otherwise, I seem to be stuck on 20m ...

Thanks.
Jeff - VA3JFF / VE3CW

double check the ribbons, between boards to make sure they are all seated correctly. one may be in at an angle, stopping the matrix board from functioning

Yesterday I installed a crystal heater from Kuhne electronics
QH40A.Its fantastics and stable as rock.After 1-2 minutes from cold start is not noticeable drift by ears in SSB.Great improoved stability
for 16 euro with shipping.Recomended.

Thanks Dave. That was my first thought, so I unplugged and reseated each cable. Didn't help any.

Decided to do a reset, and all is once again working well.

9150. Re: TS850 PLL problem?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-02 19:45:44 UTC
From: kc5cqw
Topic: 9054 Message: 9150

I installed a PTC to my 20MHZ PLL crystal and get no more then 2Hz drift after a few minutes.
Here is the DigiKey part number for the "heaters" 235-1121-ND
Basically, unsolder one of the leads and solder that side to the crystal can.
Route the other lead to the 5V source on the TXCO option area.
Next, solder the removed lead to the top of the can and to a common ground point.
Finally, carve a small styrofoam block to cover the crystal and glue in place.
Hint: unsolder the crystal for this mod and resolder to the PWB on its side.

I had also idea used PTC thermistor.But I have not information about specific model with temperature about 40 degrees celsius from source 8-12V.So I installed relative cheap QH40A electronically stabilised 40degC from output 78L09.Late for me,but good information for next guys with drifted TRXs.

I have checked the squelsh and all the knobs, but nothing seems to work and
the signal meter fluctuates. I am at a lost.

Is the s meter flucuating, or staying at a steady reading.... maybe rf
gain turned down, which causes leds to rise, and could be above reception
level.

check to see if rf is fully clockwise

Hello all, I am selling a Kenwood TS-850S with hand mic. It is original owner (SK). I am doing this for the widow so have no $ interest in sale. Asking $650.00.

Original Box, packing, Manual, Includes power cable w.fuse, I believe the optional filters; YK-88C,YG-455C have been installed. It is in good shape. S/N 31100088. Apple Valley for pick up. or will ship for cost. contact Christy KB6LTY at this yahoo email. 73

That sounds like a great idea, Damon! I wonder if some additional insulation (such as heatshrink tubing) around the crystal might tighten-up the temperature control.

Digi-Key charges $5 for orders under $25. The cost of the 235-1121-ND (Thermometrics pn RL3006-50-40-25-PTO) is $2.26. It'll set you back $7.26 plus applicable state sales tax. Allied Electronics has it for $1.15 (stock number 837-3005)... and no surcharge!

Hi

Have anyone ever changed the PA unit transistor of TS2000?

Today I could smell some bad smell of my TRX while transmitting on 30m.

It still gives its power in CW/SSB/RTTY, but I guess maybe something coming
:D

9158. TS850 & Panadapter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-06 05:40:50 UTC
From: Bryan
Topic: 9158 Message: 9158

Hello Group,

For once, I have a question for those in the group with brains larger than mine. I have a TS850SAT that I'm curious about use with a panadapter. Previously, I married my olde Heath SB620 'Scanalyzer' to my olde TS120S & TS130S rigs and it worked FB.* I was able to sweep the entire band. This was possible because those rigs were single-conversion with only a bandpass filter on the frontend. The only issue was the small CRT, making it hard to separate signals when sweeping more than +/- 50 KHz.

Now, with the '850, I see there is a 20 KHz 'roofing' filter at the output of the first mixer (73.05 MHz). Obviously, were I to connect my SB620 (or other panadapter) to the output of the 2nd mixer, I would see only +/- 10 KHz from the received frequency. I would like to sweep at least +/- 50 KHz but don't want to give up the roofing filter.

So, I'm thinking I will need to pick-off prior to the roofing filter, mix it down to 8.83 MHz, and then feed it to my panadapter. In the interest of not reinventing the wheel, has anyone done this and if so, what parts have you used?

I'm thinking I'm going to be purchasing some Mini-Circuits modules (a mixer), and homebrew a buffer amplifier. By mixing the 73.05 MHz mixer output with the 64.22 MHz LO2, I would have 8.83 MHz. A low-pass filter would reject the unwanted signals.

Heck, if I can make it work, I may even pony-up for the LP-Pan stuff (so I can use a WIDE 'puter display). :D

73,
Bryan WA7PRC

* The input amplifier on the SB620 (wired for 3395 KHz) can be switched to operate as a mixer... 12225 LO - 8830 Input = 3395 KHz. I used a dead-bug oscillator w/ an old 2M xtal... 146.76 / 12 = 12.23 MHz (close enough to adjust the SB620 sweep oscillator).

9159. TS-850 complete line.

Hi, wath is the realistic quote for this Kenwood line :
ts-850sat(with SSB filter) + MC-60 + DSP-100 + PS-52 + SP-31 + SM-230
All the components are like new.
Tnx!

9160. Re: TS850 & Panadapter

Bryan

No need to go to all this trouble!

The TS850 already has an 8.83Mhz IF output jack on the back.
This is not restricted by any filtering and gives me 90Khz (i think limited by my sound card).

It is quite low level, so might need a small amplifier depending upon the sensitivity of your SB620, but I tap it to a "softrock" with no problems.

Regards

peter

Previously, I married my olde Heath SB620 'Scanalyzer' to my olde TS120S & TS130S rigs and it worked FB.* I was able to sweep the entire band. This was possible because those rigs were single-conversion with only a bandpass filter on the frontend. The only issue was the small CRT, making it hard to separate signals when sweeping more than +/- 50 KHz.
>
> Now, with the '850, I see there is a 20 KHz 'roofing' filter at the output of the first mixer (73.05 MHz). Obviously, were I to connect my SB620 (or other panadapter) to the output of the 2nd mixer, I would see only +/- 10 KHz from the received frequency. I would like to sweep at least +/- 50 KHz but don't want to give up the roofing filter.
>
> So, I'm thinking I will need to pick-off prior to the roofing filter, mix it down to 8.83 MHz, and then feed it to my panadapter. In the interest of not reinventing the wheel, has anyone done this and if so, what parts have you used?
>
> I'm thinking I'm going to be purchasing some Mini-Circuits modules (a mixer), and homebrew a buffer amplifier. By mixing the 73.05 MHz mixer output with the 64.22 MHz LO2, I would have 8.83 MHz. A low-pass filter would reject the unwanted signals.

> Heck, if I can make it work, I may even pony-up for the LP-Pan stuff (so I can use a WIDE 'puter display). :D
>
> 73,
> Bryan WA7PRC
>
> * The input amplifier on the SB620 (wired for 3395 KHz) can be switched to operate as a

mixer... 12225 LO - 8830 Input = 3395 KHz. I used a dead-bug oscillator w/ an old 2M xtal... 146.76 / 12 = 12.23 MHz (close enough to adjust the SB620 sweep oscillator).

I was curious about that same part of the circuit ... there was a
discussion earlier about the Inrad roofing filter blocking out the
bandwidth and thus making panadaptor functions ineffective when tapping
the 8.83mhz IF.

Someone posted the high IF filter bandwidths in the group files:
http://f1.grp.yahoofs.com/v1/sIS7S984OuCiv7TS3oDYZ58ciJmfVNQt0YbnoEvdSRvZuIGVVvdW-pmwCx1Fk
8tcmZxPk6rIwkAllpYOEtfbgkqrKOW2VVsJhYg/850%20Filters/TS850_vs_Inrad_Roofing_Filter.GIF

The stock curve for the TS-850 has 20db loss where it's about 30khz wide -
so are the signals you see in your 90khz pass attenuated a lot when
they're far from the center? Am I reading that graph wrong?

I'd love to be able to get the roofing filter benefits but still have a
wide IF signal path to LP-PAN, but I realize they are at cross purposes.
I guess that would require a second mixer bypassing the roofing filter.

73,
- Dave W6OT

9162. Filter Dip Switch Question

Yahoo group: TS-850_450_690 (2010 — 2016)

From: Crownhaven
Topic: 9162 Message: 9162

If you remove a filter, i.e., 250 Hz 8.83, does the dip switch setting have to be changed if nothing replaces it??????? It appears to make no difference.

Has anyone ever bothered to look at the schematic? Rather than guessing why not look. If you did you would discover a tap right after the 73.05 MIXER, well before the roofing filter. It is fed to a FET mixer all by itself which converts it to 8.83 and then is output to the back. Bandwidth is limited to the RX BPF of whatever band you are on.

Contrary to popular belief Kenwood didn't fall off the turnip truck yesterday... GRIN.

I was trying to clear up what was stated back in message 9003 on this list
about using pan adapters:

"If you have a 20KHz wide roofing filter, that's all the bandwidth in
which you're going to see any signal(s)."

That, I'm glad to hear, is apparently wrong, so I'll happily put a INRAD
roofing filter into my TS-850 and also use LP-PAN.

I have a rather nice condenser mic with a balanced output--a three-prong canon plug. I have no trouble providing phantom power--but I don't know exactly how/where to get the audio into the rig. I can get a 'line' or 'mic' level, either one.
Regards,
Jonathan KC7FYS

Topic: 9158 Message: 9169

Hi Peter,

I tried connecting to the IF OUT1 jack but (so far) nothing. You may be right about the '620 needing to be driven harder. With my previous TS120S & TS130S rigs, I fashioned a buffer amplifier (about 14dB gain). I may need to do the same with the 850. I have a bunch of MMIC devices that should work FB.

So, another question... does anyone know what level I can expect at the IF OUT1 jack? The only thing I see in the service manual (page 101) is in the alignment section. It says, with 90dBu input, to peak L64 & L65 for maximum level.

And, thanks to all who've replied to my previous question.

73,
Bryan WA7PRC

Searched the Kenwood parts store and got this back: first time for this 850S newbie so does anyone know if one of these parts is "better" than the other? They are the same price.

I get this forum in digest format so it may be a bit before I respond to anyone posting an answer to this question.

Tnx es 73, Chris W7JPG

"Same part number!!!"

Yep, I saw that, too. Both parts did include the same part #. What I was asking is if there is any preference to the part with the prefix "KEN" (mfgd by Kenwood??) to the part listed as "Substitute Unit". There are so few parts involved it seems like it would not make any difference but I figured it would make sense to ask this group, anyway.

chances are that Kenwood parts will supply the substitute, and you would
have no choice in the matter. from what I heard they are getting scarce, and
take what is available...

9174. TS850 receiver problem?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-11 20:51:44 UTC
From: rovntoma
Topic: 9174 Message: 9174

After first transmission recieved signals (and noise) going dramatically up.The difference is 2-3S.I have 3el delta loop for 10m band with rotator.When I rotate antenna recieved signals dropping down.Also rotate back to the same position is not good.After first TX or pushing AT tuner on new position signals going up.When antenna stay on position,it is no problem,when is moved signals drops.Also drops after turn OFF/ON when AT tuner is not in auto mode.I used upper bands only and situation is the same for all upper bands.
1.I check small board X51...Surge absorber is smoked in the glass.
2.First relay TX/RX can be a problem?
3.It may be common problem D31 or Q49?
4.It may be AT tuner is in RX mods?

Any idea whats can be wrong?Or it is a normal?

9175. WWV Calibration

Topic: 9175 Message: 9175

Hi folks. Need some help.
I need to calibrate my TS850SAT to WWV on 10 Mhz. Need to know the correct procedure please

9176. Re: [TS-850_450_690] WWV Calibration

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-11 23:53:15 UTC
From: Steve Gehring, NL7W
Topic: 9175 Message: 9176

This procedure has worked well for me in the recent past*: *****

A Quick Dial Calibration Check (thanks to K6LL):

1. Tune the radio to 10Mhz, so you can hear WWV.

2. Press the "tune" button on the radio (keypad #7).
3. Set vfo A to 10000.10 KHz, or 10000.50 KHz [Use the keypad for exact frequency entry with the synthesizer].
4. Set vfo B to 9999.90 KHz, or 9999.50 KHz [Use the keypad for exact frequency entry with the synthesizer].
5. Flip back and forth between vfo A and B. On both, you should hear a low tone of about 100Hz [or 500 Hz if you choose the 500 Hz offset], just off zero beat of the WWV carrier. If the tones are not equal in frequency, adjust TC-5 on the PLL Unit, as follows:

TS-850 Quick Dial Calibration

6. Remove the TS-850 top cover.
7. There is a three-stack of boards on the left side of the radio. On the left side of the lowest shield, there is an elliptical cutout. Peek inside, and you will see the screwdriver-adjustable pot TC-5.
8. Make small adjustments to TC-5, and repeat step 5 above until the two tones are exactly equal in frequency.

It works...

I have an TS-850 which suffered i presume a bout of rouge EMP. This had the effect of removing the receive capabilities completely. It still however,transmits with no apparent problems. I have looked at the surge protector and it is still intact and measures a 50 OHM resistance which i would presume to be correct. I wondered if it could be a problem with what i would presume to be a switching relay to the left of the surge protector. Could anyone please advise any help would be of benefit.

Thank you Shaun M3ULT

The resistance from the antenna connector to ground should be 47,000 ohms. Start by removing the surge suppressor and most likely replacing the 3 caps on the RAT line of the Filter unit B/3.

Paul,

Do you have a soundcard interface of some sort?
I use a Tigertronics Signalink USB.
If you don't, get a 1/8" stereo patch cord from Radio Shack; you may need a 1/8" stereo to 1/4" mono adapter. You could also build one if you have the parts.

Basically, what you are going to do is send audio from the phone jack to the soundcard input.

Use this program if you have a PC:
http://www.zeitnitz.de/Christian/scope_en

Use this one for a Mac:
http://www.dogparksoftware.com/iSpectrum.html

Before you begin, make sure the room temperature is stable at your normal thermostat setting (If you have the TXCO installed, you can skip the thermal stabilization steps).
Next, open the top cover and drape a towel over the radio.
Now turn on the radio and let it warm up for about an hour or longer.

While it is warming up and stabilizing, tune into WWV at 10, 15 or 20MHz. You will want the highest frequency possible with a solid copy on AM.
With the software running and the spectrum/waterfall on screen, set markers for 500Hz and 600Hz.
The tones will alternate on the minutes that tones are TX from WWV. Look at: www.nist.gov for a broadcast schedule.

In AM mode, you should see a peak at 500Hz or 600Hz right on top of the markers.
Hint: If at any time you are not sure of the TX tone, just switch back to AM.

One or more hours after warmup...
Move just enough of the towel to the side to permit a NON-conductive flat bladed tuning tool into the reference adjustment access hole. Get a good purchase on the trimmer cap.
When you begin, it may be a little stiff, they tend to stick a bit after not being turn for a while.

Now in AM mode, verify the audio tone being TX for that minute.
Switch over to LSB or USB and see how far the tone has shifted (if at all).
Turn the trimmer cap until the tone is inline with the marker as needed.
Switch to the opposite sideband and verify the same.

It may take some practice to do this within one minute; remember that the tones flip flop!

Adjust the zoom within the software to give you more close in detail for finer tuning.
Now just dial it home as needed. A little movement here goes a long way so don't over shoot it.

Verify the alignment by toggling the sidebands. The tone should not move very much off from the marker.
Once you are satisfied, cover the radio and let it sit for an hour. You should not see any drift on screen. If you do, readjust as needed and let it stabilize for one more hour.
If it stays put, your all done! Now put the cover on and operate.

I have my TS-450S within 2Hz (0.7-1.5Hz) by using this method. I'm too broke to install a So-2 TXCO so I made an OCXO with a PTC soldered to the 20MHz XTAL and have it covered with a carved block of styrofoam. The general idea is as long as the inside of the radio doesn't go above 104 deg. F, it will be stable. 104 deg F is the cutoff temp for the PTC. It cost me about $3 and is rock solid for the digital modes!

Good luck with your calibration, if you have any questions email me at: KC5CQW at GMAIL dot COM.

73, Damon

Just purchased a used TS-450SAT from Craig's List and have two questions:

1. Advice on how to remove the main tuning knob for cleaning. It has what appears to be a set screw hole but I do not see a slot for a screw driver.

2. It came with the standard hand held mic. Any suggestions on a desk mic (other than the prescribed Kenwood MC-60A)?

Thanks and 73,

Tom - AF8P

Hi Tom

Why not think about a boom mike? I have used one for a long time and it really frees you up instead of having to sit right in front of the mic. I use the Heil here.

I actually use mine on a pair of Radio Shack cordless headphones. Mounted it with some velcro. Now I need to figure a way to have a cordless mic to go on the cordless 'phones. 73

Hi Tom

Why not think about a boom mike? I have used one for a long time and it
really frees you up instead of having to sit right in front of the mic. I
use the Heil here.

I actually use mine on a pair of Radio Shack cordless headphones. Mounted
it with some velcro. Now I need to figure a way to have a cordless mic to
go on the cordless 'phones. 73
Tom W7WHY

2. It came with the standard hand held mic. Any suggestions on a desk mic
(other than the prescribed Kenwood MC-60A)?

Thanks and 73,

Tom - AF8P

My TS-450's mic is an ICOM SM-8, I change pin-out order to match to my kenwood rig.

I got an awesome audio

9190. New User CW Question on TS-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-19 15:43:39 UTC
From: Tom Waraksa
Topic: 9190 Message: 9190

Dear Group,

Just purchased a new (to me) TS-450S and got it on the air this weekend. Question: When operating CW do you call the other station above or below their operating (zero beat) frequency? With my Heath HW-8, you call the other station from above their frequency. I assume the same is true for the TS-450 since the receiver is receiving on the USB.

I know the rig has a "REV" BFO function, but I am talking under normal operating settings.

Thanks,

Tom - AF8P

I don't have a 450 but with the 850, there is a "pitch" adjustment. You are zero-beat with the station you've tuned in when the pitch you hear matches the setting you've chosen. I have the pitch setting set at 700 Hz. When I tune in the CW station to have a 700 Hz pitch (which matches the sidetone pitch BTW) I am zero-beat with him.
I hope it's the same on the 450.

Zack,

Thanks for the prompt reply. I have my sidetone pitch set at 800Hz which is the factory default. Unfortunately, with the 450, there are actuall two frequencies at which I could zero beat with the received signal. That would be 800Hz above and 800Hz below the other station's frequency. On my TS-820 I don't hear both, just one.

Hope I am asking the question correctly.

Thanks and 73's,

Tom - AF8P

Hi Tom

I have 2 TS-450SAT's here and love 'em.

Just tune the station in and call them. When the tone is right for you, you're on frequency (or close enough for government work). 73

Hmm ... is your IF shift knob set right? It should have the index pointing
at "0". Seems if this is set right and you're in CW mode, with a 500 Hz
filter or narrower, you should only be hearing one side of the CW signal.
But assuming you're in regular CW mode (CW) and not reversed CW mode (CW-R),
you should be tuning up from below the signal in frequency.

If he's hearing the CW note both above and below then he's using the 6KC filter position.

Yeah, that's why I noted "with a 500 Hz filter or narrower." With my TS-850, using the 6 or 12 kHz wide filter positions enables me to hear the CW note on the other side of zero-beat.

9200. Digital sounding noise on some frequencies, YM6631 failure?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-20 19:35:14 UTC
From: synthetik22
Topic: 9200 Message: 9200

Hi Group,

I just have my hands on a TS 850S which I have received from some other OM. He wanted to sell this rig to me, but while testing I found lots of strange sounding digital birdies on every band (about 10hz wide, 500Hz distance) This all sounds after a severe digital distortion. All caps on the CAR bord have been exchanged, just to mention that. It seems to be a termal problem, as the distortion freqeuncy is moving during startup. It almost disapears after a while. E.g. I got proper RX from 7,00000 to 7,00050 and then only distortion noise untill 7,00060 but then again the RX is fine... Now, if I slightly cool the chip IC1, the distortion moves up or disapears for a while. I checked all other parts with the cooling spray but only IC1 (YM6631) reacts on this. Do you think that IC1 (YM6613) is the problem? If yes, where can I get one? It seems hard to get this part. I already spend some time googling and mailing but was unable to find someone who would share one part (of course fo r money in exchange).

Any ideas?

best 73s Tobias DG3YEV

Clif,

Thanks to all that have replied, but Clif, you make a great point. Never had a rig where you could chose your IF bandwidth filters before. I will run a test and let the group now.

Thanks,

Tom - AF8P

If he's hearing the CW note both above and below then he's using the 6KC filter position.

Yeah, that's why I noted "with a 500 Hz filter or narrower." With my TS-850,
using the 6 or 12 kHz wide filter positions enables me to hear the CW note
on the other side of zero-beat.

Topic: 9204 Message: 9204

Hello, I am experimenting with a aerial for top band, to use with my TS-850s.
I can transmit OK up to 1.849 but not on 1.850 up.
The manual says it should have a frequency range of 1.8 to 2.0 MHz.
Any thoughts?
Barry M0IOW

9207. Re: TS850 & Panadapter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-24 18:42:56 UTC
From: Bryan
Topic: 9158 Message: 9207

I didn't get a response so, I figured it out on my own. The matching panadapter for the 850 is the SM230. The service manual for that unit states the input sensitivity is 20 dBu/DIV. The user manual states 10uV/DIV (the same as the service manual, stated differently). There are eight divisions on the CRT so, full-scale deflection requires 80uV. My SM220 w/BS-8 states the same sensitivity. I don't like how it works (terrible drift, PITA to change between TX & RX monitoring, lack of graticule marking for panadapter use, etc). So, until I get setup with LP-Pan, I needed to determine the input sensitivity of my SB620 (w/ input amplifier configured to operate as a mixer).

I pumped an RF generator into the SB620 until it deflected full scale (550mV @ 12.23 MHz heterodyne osc injection). Result: 200mV RMS. This tells me I need Av = 2500 (200mV / 80uV), or about 68dB gain. I have four MAR-3 MMIC amplifiers built that give me 10dB power gain or, if unterminated, 20dB voltage gain. I expect I'll need good shielding and decoupling between stages. As they say, "Film at 11:00"!

73,
Bryan WA7PRC

Bryan WA7PRC wrote:
>
> Hi Peter,
>
> I tried connecting to the IF OUT1 jack but (so far) nothing. You may be right about the '620 needing to be driven harder. With my previous TS120S & TS130S rigs, I fashioned a buffer amplifier (about 14dB gain). I may need to do the same with the 850. I have a bunch of MMIC devices that should work FB.
>
> So, another question... does anyone know what level I can expect at the IF OUT1 jack? The only thing I see in the service manual (page 101) is in the alignment section. It says, with 90dBu input, to peak L64 & L65 for maximum level.

i guys im still trying to figure i have no transmit output power .i have email clff a couple of times and what he found was i only have 38,8 ohms at the antenna conector and cliff says should be 47.9 or 48.9 somethink like that and there is my problem but i cant find it yet for one only have a VOM digital job but i have ckecked the caps for leakage looks ok and it has the newer chips in it batterys ckecks ok finals cked ok .
but here is what happened i was listen one day well everyone started to sound like they had rf on the signal and keep getting worst till i could understand no one cut the radio off and back on clear as a bell . 15 minures later same think . so im thinging something is getting hot . ok then the radio became clear as a bell agin no rf sound on there audio . but thren i was going to talk to someone and i seen i had no audio and signal going out no output power so i agn put headphones on hit the moni button and i can here myself whistle and audio but it shows nothing on the watt meter . i also looked at the dc -dc board for those 4 caps there are none to leak loks good ..
im not the smarts cookie in the jar . i need help pse any ideals i also had the oh the automatic tuner doesnt work but cliff told me it would because no power out .
i have ckecked c1 on the car -unit .
i never notice the acl jumping or power going up and down was alwas good .
somethink goog hot and blow and i cant find it or where to look i have a servce manual on the way .mit help .

You didn't read my e-mail correctly.

You should have 50,000 ohms at the antenna connector.

I am thinking of selling my 850SAT (50 mil serial) with optional CW filters in both IF's (a 250Hz in the 8.8 and a 500 Hz in the .455) Built in antenna tuner wors fine. I am original owner, purchased in 1993 for $1,800 from R&L, then added the 500Hz filter.

The only mods to the rig are the noise blanker mod and the 60 Meter mod (diode clip to open up transmitter to allow 60 Meters)

I have been thinking of selling it help[finance the purchase of a Flex 3000 or Flex 5000. (I can't believe I am typng this now, because I have LOVED this rig.)

I haven't put a price on it yet. I am still researching it, and also whether to sell the filters separately. Is this the serial # range you were looking for?

Tell me more about LP-Pan... Is that an adapter that hooks up to the panadapter port and uses the Power SDR software?

9216. TS690SAT for use on LF 137 and MF 500

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-27 09:24:17 UTC
From: James Cowburn
Topic: 9216 Message: 9216

Dear All,

I have a kenwood TS690SAT and I want to use it on LF (137KHz) and MF (500KHz). Has anyone got the mod for the removal of the broadcast attenuator. I gather it is just a jumper that needs to be made/unmade but cant find a reference for the location anywhere on the web.

Also I have done the MARS/CAP mod and the TS690S will tx down as far as 1.7MHz but no lower. Is there another mod that will take the TX range to match the RX?

I know the BPF array is not designed to cope down that low but I will only be using very low power to drive a LF/MF amp so it should be fine. I have an ICOM 706mk2g which is quite happy at 500 giving out 10w and keeping cool so I would guess that the 690 should be similar its just a case of getting it to fire up

Thanks for any suggestions/guidance/pointers

With best regards

9219. TS-450S Crystal Filters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-04-27 18:01:14 UTC
From: Tom Waraksa
Topic: 9219 Message: 9219

I am looking for a crystal filter for my TS-450S. Specifically the "YK-88C-1". The Kenwood part number is "L71-0236-15". Do these come in both screw mount and solder mount packages? Will either work in the rig? I have never seen a screw mount on eBay or QRZ.

Thanks,

Tom - AF8P

The screw mount and solder mount are not interchangeable, different center frequency.

That is a 500 Hz filter. It is on a board with holes on each end that you plug into the board on your radio. There are dip switches that have to be manipulated to enable it. Further, there are a couple of screws to hold it in place. When you install it, just make sure you have the prongs in the radio perfectly aligned with the filter so you don't bend anything. Even I can install one of these.

I have the filter in a TS-850S/TS-450S and TS-690S along with the YG-455C-1 which is the 500 Hz filter for the other IF. I also have a TS-850S with the INRAD 400 Hz filters in them. I am a CW operator although not an HF contester. I am chasing DX typically. The 500 Hz filters are fine for me. I don't really like a filter narrower than 400 Hz. I typically listen with the radio wide open and use the filters when needed once I find someone I want to work.

I know I am going to get blasted here but I personally can tell only a small difference between the INRAD and Kenwood filters. Caveat......I'm not using them in crowded bands, contest conditions. Perhaps someone with more experience can make the case for the INRAD filters but I'm fine with the Kenwood pair as well as the INRAD.

I do like having the YK-88SN-1, 1800 Hz filter in the mix too. I was going to buy the same filter from INRAD and see how that worked out. The SSB filter is definitely a plus in the 450/690 but not necessarily as valuable in the 850.

Other's mileage may vary. Filter discussions are always interesting. As another fellow said, "I'm not trying to start a fight here." :))))))

Regards,

Steve, N4JQQ

Actually Tom, there are both a YK-88C-1 and a YG-455C-1 listed on eBay right now. Both from the same seller, both auctions ending in 5 days... These are both plug-in filters appropriate for your TS-450S.

Cheers,
Chuck, WA3CEJ

Hi Tom

I have 2 TS-450SAT's here, and in one of them I have the plug in filters and the other one I soldered the filters in (I happened to have some Fox Tango filters with out the plug in board).

You might check www.qth.com/inrad for their filters. Much, much better than the Kenwood filters. 73

I have owned a TS-850-SAT since it was new, and I loved it (and I still do!!!)

I was given a Icom 756 Pro-III about 6 years ago, so the TS-850 was put away.

Now I want to get it back in service, and would like to have some of the standard mods done to it, and check for leaking caps, etc.

Can anyone recommend a tech guy that can do them - I am 68 and my eyesight (and my hands) are not what it needs to be to work on SMT boards.

Thanks for any recommendations you guys can make.

I was very satisfied with Clif's service too. I wonder just how familiar Kenwood's current techs are with the older radios? Might be that Clif has more experience with the older stuff than they do which could save diagonstic time (money) P.D., KC5EN

I am sure Clif would be much more reasonable and you would triple your
chances of a proper diagnosis.

I agree that Cliff is the guy to send it to. What I don't see is any reason to send to anywhere...

When you got the 756P3, was the 850 working properly? If so, I think you should determine if it is STILL working properly. Then, maybe, consider sending it to Cliff if the performance warrants it.

But that's just MY opinion...

Cheers,
Chuck, WA3CEJ

9233. TS-450S/690S Knob wanted

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-03 05:17:16 UTC
From: taylorla93292
Topic: 9233 Message: 9233

I'm in need of a control knob that is missing / lost on a Kenwood TS-450S.. I gave the radio to my son when he passed his Extra Test, but it feels incomplete with out that knob on it. He loves the radio and it works great.
Its a center knob on a dual shaft control on the right side of the front panel. Listed as a Notch, or RIT/XIT, or a AF control. They all have the same part number. (K29-4515-04)

Thanks for any help!

Better check to make sure the battery and caps aren't leaking. KC5EN

9235. TS-450 low volume

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-05 21:40:40 UTC
From: Rodrigo
Topic: 9235 Message: 9235

Hello

After a year without use, I decided to turn on my Kenwood ts-450sat to check things out and for my surprise the audio came out very low on the internal speaker...I also tried the external speaker and same thing...Played with all the front panel controls..same thing..no luck.

Opened the case to check the speaker itself and it is fine, plugged another one in place same results...very low audio volume, regardless of band, mode or position of any knob etc...

Has anyone noticed same problem with this radio?

Any help would be appreciated...

Thanks in advance.

Rod

Hi Steve,

Yes...all checked...this was the first one....back and forth with all the controls...

Curiously, when I first powered it, I rapidly lowered the volume expecting a loud white noise...but instead I heard that cracking noise of old TV dirty volume control...and that was the end of it...moved the knob back and forth expecting to clean a dirty cursor track, but no good.

Now the volume control works, changes de volume smoothly, but it won´t go any near as loud as usual, maybe even much less than 10% of the normal volume.
On SSB I have to put my ear touching the speaker to hear anything...on FM I can hear noise, like if it was coming from headphones.

I also have reset the CPU with no luck.

Thanks

Rod

Sure, big old leaking cap on the IF unit. Brown one about halfway back on the left side. Eats traces, low to no audio...

Hi Clif

Thanks for the hint...seems that you know a lot about this radio..but Im not that familiar with the 450....
and taking a closer look I could not find any caps as you described. I see only a brown one on the botton (picture) next to a white connector and writings "L12". Is that it?

I´ve added a picture of the IF unit (I guess) or follow this link...

http://k8su.com/SP940Kenwood/Ebay/Kenwood-450/Kenwood-450-IF-Unit.jpg

Could you point where is it exactly if possible?

Thanks and appreciate you help

That's the one. See those black traces going to the right in the picture? One of those is the audio line. Black is not the normal color for traces, it means the cap has leaked and damaged them. Start cleaning.

Hi Cliff

I managed to find the capacitor...it is the one mentioned below....and yes it had leaked!! Removed the cap and cleaned-up the area...

By the way...the pic is from someone else´s board.

It is the C104 at the output of the AF amp...IF unit...on the diagram (service manual) it is located on the upper right corner of the sheet. It is in line with the output of the AF amp and if anything happens to this cap, you will sure get no audio on the speaker.

I just got the replacement today...strange there are several capacitors with same or close value on the board, all blue...this is the only one brown...go figure!

I will let you know how it goes when it is done.

Hi

The capacitor has been replaced..the audio went up...no as much but...another thing came out...and it was there, along with the low volume.

When you turn the radio on, the RF bargraph goes up..takes about 1 or 2 seconds to reach 9 +30 on the display and stays there...and the volume goes down for sure...and that without touching anything...when you switch to AM or other mode, the audio comes up a little but not much...

The beep sounds when a key is pressed seems that are back loud as usual...so it is ok

so I believe there is also something wrong with the RF sensing or circuitry also...

any hints?

Rod

You can't just replace the cap. You have to remove components and clean under them. The AGC line goes thru the same area and is being shorted by the gook. It also damages thru holes and causes all sorts of grief.

I´ve also noticed...If the radio gets warm, the bargraph goes down and stays...if I turn it off, let it cool down and turn on again...the bargraph goes up again...so it is somehow temperature related I believe.

All,
I picked up a TS-690S from a buddy of mine a few days ago, works fine over-all except for a problem in CW mode. When in CW mode, if I set the VOX to on, the radio goes into tx and the only way to get it out is to cycle the power. If I use the SEND button and then switch it back to rx, same thing, have to cycle the power to get it out. Same goes for just keying the mic in CW mode. What I've checked so far:
1. Checked the key jack to make sure there was not a mechanical failure.
2. Set the ANTI-VOX to minimum (fully counter clock-wise).
3. Checked all settings per user manual.
4. Connected key to radio (thinking it may need to be in line).
5. Set the DELAY from min to max (and all points between) for rx recovery time in conjunction with VOX. Still no joy.

I was looking through the service manual and get the feeling there may be a voltage problem somewhere in the keying circuit. Before I jump in up to my elbows tracing the circuit, anyone else ever encounter this problem? If so, what was your cure?

Thanks, Jim - W8LGZ

is the lock bar ON on the key???

anti vox should be a max, i think to stop keying

also is the mike still plugged in.. try without the key, and without the mike. if it unkeys, then problem is external to the radio

Try testing it into a dummy load. I have seen strong/stray RF lock a transmitter on. Bob WE6C

Hi, Bob,

Normally, I would agree with stray RF could be locking the transmitter on. However, in this case with the mic & key disconnected, send button in receive position and no other rf being transmitted in the shack, if I push the VOX button to the ON position, the transmitter will engage without anything else being done...just turning on the VOX. It's strange. That's why I'm thinking a voltage problem internally. Thanks for the suggestion!

Jim

Thanks for the reply, Dave,

> "is the lock bar ON on the key???"

No, it is not (actually, doesn't have a lock bar...cheap straight key. I prefer paddles).

> "anti vox should be a max, i think to stop keying"

I have set the anti-vox at all levels from min to max with same result.

> "also is the mike still plugged in?"

I have removed the mic and key, left both installed, makes no difference. I too am thinking this is an internal problem with the radio, somewhere in the keying circuit I believe. when I get it figured out, I'll post what I find for others benefit.

Thanks! Jim

Hi, Bob,

Normally, I would agree with stray RF could be locking the transmitter on. However, in this case with the mic & key disconnected, send button in receive position and no other rf being transmitted in the shack, if I push the VOX button to the ON position, the transmitter will engage without anything else being done...just turning on the VOX. It's strange. That's why I'm thinking a voltage problem internally. Thanks for the suggestion!

Jim

Hi all,

I have a ts-850 + dsp 100 .

Does someone try to use a microphone yaesu MD-200 with this combo ?

Many thanks for any commentary,

Regards

Allan

9254. Re: TS850 & Panadapter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-10 20:15:00 UTC
From: joefargo
Topic: 9158 Message: 9254

I have both the SM-230 monitor scope and the LP-Pan unit. The LP-Pan is much more sensitive and much more useful compared to the sm230 in terms of just the spectrum display. There isn't a huge difference between the sm220 and sm230 except the 230 has a lot larger crt, hence a bigger display.

The LP-Pan takes a lot more figuring out, a lot more learning to use, but is well worth the trouble.

I had big problems with the external sound card I used with the LP but it turns out, the internal card in my pc does an acceptable job for now. Win7/64 is troublesome, but can be made to work one way or the other. Once they have drivers for the em-u 0202 for win7/64 I'll be a happier camper, but for now I'm getting a bigger better more useful display with the lp-pan than I get with the sm230.

>
> I didn't get a response so, I figured it out on my own. The matching panadapter for the 850 is the SM230. The service manual for that unit states the input sensitivity is 20 dBu/DIV. The user manual states 10uV/DIV (the same as the service manual, stated differently). There are eight divisions on the CRT so, full-scale deflection requires 80uV. My SM220 w/BS-8 states the same sensitivity. I don't like how it works (terrible drift, PITA to change between TX & RX monitoring, lack of graticule marking for panadapter use, etc). So, until I get setup with LP-Pan, I needed to determine the input sensitivity of my SB620 (w/ input amplifier configured to operate as a mixer).
>
> I pumped an RF generator into the SB620 until it deflected full scale (550mV @ 12.23 MHz heterodyne osc injection). Result: 200mV RMS. This tells me I need Av = 2500 (200mV / 80uV), or about 68dB gain. I have four MAR-3 MMIC amplifiers built that give me 10dB power gain or, if unterminated, 20dB voltage gain. I expect I'll need good shielding and decoupling between stages. As they say, "Film at 11:00"!

actually all ts850s' are vintage. they have not made them since 1998?? i think.... so I would say yes, cap failure is not dependant on hours of operation, i dont think.... mine is same serial range, and mine had gone bad, so they have been replaced. cost me 2 dollars for new ones (electolytics) at a local swap......

Villy,

It not only a matter of time, but also temperature, air pressure, moisture. Sooner or later every electrolytic cap starts to leak. They all have a limited lifetime. I have a 5xxxxxxxx series 805SAT here and all was fine with the caps but I decided to change all before they go mad. I used to repair al lot TVs and radios in my career and that is just my experience. If some elektronic device gets old, change the caps to keep it alive.

Hi Joe,

Thanks for the reply. When I get a 'roundtuit', I'll definitely get setup with LP-Pan. It'd be even cooler if it could do TX monitoring as well (envelope and trapezoid). I wonder if anyone has suggested it to Larry N8LP.

But, right now, I already have the SB-620, and wanted to get it playing. Even though it uses vacuum tubes, I feel it's much better suited as a Panadapter than the Kenwood "all-in-one" SM220/SM230 units.

I was able to make my SB-620 play by daisy-chaining four MAR-3 MMIC amplifiers together (44dB power gain @ 8.83 MHz). I could use another 20dB gain, and have simulated a couple of Analog Devices AD603 variable gain amplifiers.

73,
Bryan WA7PRC

Aloha Abel,

I use the signaLink USB with my 850 here is how you do it.
1 open the signalin USB by removing the front 4 screws.
2 in the back you will see a 16 pin dip socket marked JP1 that is where the jumper wires go.
3 pin 1 goes to SPKR
4 pin 2 goes to MIC
5 pin 3 goes to PTT
6 pin 4 no connection
7 pin 5 no connection
8 pin 6, 7 & 8 goes to G
reassyemble and plug it in it's ready to go.

73 and have fun

Aloha Roland, Very kind of you.
As the manual says you can not disconnect the wires once you have
put them into the socket JP1, so I will need to cut them ,and then
will solder according your advice.
Have a nice time there .
Bye Roland de EA3AQS Abel.

Aloha Abel,

You can move the jumpers you just have to be careful when you do it.
Here is the 13 pin din to RJ-45 pinout.

1. Pin 3 on 13din to pin 1 on rj-45
2 Pin 11 on 13din to pin 2 on rj-45
3 Pin 13 on 13din to pin 3 on rj-45
4 Pins 4,8 & 12 on 13din to pins 6,7 & 8 on rj-45

I have built 2 of these cables myself.

As I said you can move the jumper wires use a pair of small needle nose and pull stright up. or get a 16pin dip socket or 2 and jumper them for differnt radios then it's plug and play.

Good Luck

Roland AH6RR

9268. SO-2 TCXO for sale

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-14 18:17:16 UTC
From: Colin Thomson
Topic: 9268 Message: 9268

Hi,

I have a used and working SO-2 TCXO for sale. I recently calibrated it so there is a small flap where I carefully lifted part of the foil label to get to access to the trimmer.

Inquiries/offers direct to me please, not via the group.

73 Colin - G6AVK

9269. TS-690S power modification

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-15 11:56:50 UTC
From: david269140
Topic: 9269 Message: 9269

I'm now using my TS-690S as a 28MHz driver for various transverters.

Is there a simple way to drop the power down from 100W to nominally 10W
rather than winding the power control right down or putting some DC in the ALC socket.

Just wondered if there was a diode I could snip (or similar) to make it a semi-permanent solution.

It works as it is but I'm a bit twitchy in case I accidentally blast 100W into the transverters really.

73 David G4ASR

Looking forward to answers too David. I am also using a TS-450S for a 28 MHz driver for two transverters. I pulled the knob off the power control on mine to remind me. A mod would be interesting.

Dear all,

I also use TS-690S and wanted the same solution, not for the Xverter, but for reducing TX power to a minimum for my manual antenna tuning unit.....(Well, since my experiments are mostly on ATU and antena systems)

This is my plan (not have time yet to work on it....but I use the same solution for my older radio, an FT-80C.....HI) ---go to the schematic diagram, locate it on board, replace the Potentiometer (or have switch at the back panel) with fixed resistor, or semi-fixed VR with the same value.....

Just my two-cents idea...

Would it make sense to see if the schematics show how the
power is reduced for tune-mode (ATU), and see if you can emulate
that? I haven't looked at the schematics for this on the 450/690
(but I have for the 440, and it was rewarding), so I'm just
offering my thoughts...

Good Luck!

That of course also make sense.
But I am not sure about the emulation, so maybe some of you knew it?

Thanks!

I seem to have the same symptoms in my 450 that started this week.
Do these rigs share the same RF deck?
I'm about to look at the service manual before I open it up.

9276. DSP-599zx RTTY modem on TS 850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-16 02:03:09 UTC
From: nz6p_mike
Topic: 9276 Message: 9276

I want to interface my ACC2 13 pin DIN to run the RTTY modem in DSP-599zx. I am confused by the different pin identifications.

The DSP-599zx 8-pin DIN has:
1-Line Out
2-Signal Ground
3-PTT Out
4-Key Out
5-FSK Out
6-DIN Audio In
7-PTT in
8-not used

TS 850 13 pin DIN shows (only the ones with connections):
3-ANO (recvr audio fixed level)
4-Ground (audio out shield)
5-PSQ (squelch control for packet ?)
6-S meter (voltage varies with S meter reading)
8-Grounding
9-PKS (standby - mic off/transmit)
11-PKD (mic input)
12-GND (same as pin 4?)
13-SS (standby terminal - grounding transmits)

Any help would be greatly appreciated.

..mike NZ6P

I found a leaking C104 on the IF PWB so that is being replaced first.
While in there, I did the BCB attenuator bypass mod. Does anyone have suggestions on areas I should check or other mods while it is in surgery?

just by the names, it sounds like a monitor mod (a good thing) and processor mods (a good thing) assuming there were neither of these features in the radio..

can you ask who you bought it from or international radio what the mods did.

I would say, if they dont interfere with YOUR operating style, why remove them

Beware: There is a seller, on ebay, called SmileNtango, selling RAMs for PC, and they send defective parts, intentionally, so you will send it back, without refund, with the excuse that they have never received it back, all with the blessing of Ebay and Paypal ! They keep on doing this to others, all over the world, making money on defective, useless parts. What a clever way to do buisness with a little help from Ebay & Paypal !!!!!

Subject: [TS-850_450_690] Beware of Ebay

Beware: There is a seller, on ebay, called SmileNtango, selling RAMs for PC, and they send defective parts, intentionally, so you will send it back, without refund, with the excuse that they have never received it back, all with the blessing of Ebay and Paypal ! They keep on doing this to others, all over the world, making money on defective, useless parts. What a clever way to do buisness with a little help from Ebay & Paypal !!!!!

9287. ts-690s memory battery replacement

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-20 21:47:43 UTC
From: wa3sru
Topic: 9287 Message: 9287

Hi,

I am new to this group. I recently obtained a ts-690s. The battery needs to be replaced as when the rig is powered on, it reverts to the lower edge of each band. Gets tiring turning the knob to get to the freq I want. Is there a document that addresses the replacement of the battery. I looked thru the manual & don't see any reference other than sending rig to have the battery changed. Any help would be appreciated. I currently have the rig in my Ford F-250 Diesel as a mobile rig with a Little Tarheel II screwdriver antenna.

Tnx & 73's

Hi Scott,

What kind of meter are you reading the power with? If you're not using a peak-reading wattmeter and a 50 ohm nonreactive load, you won't know what your peak ssb power output is.

I am using the meter on the radio and the meter on my antenna tuner. I am going into a 50 ohm dummy load. It worked fine when first powered up. But as the radio got warm the power level dropped. I can turn the power adjustment all the way up and maybe get 20 watts max out.

were you expecting it to work flawless????? from Ebay seller???

how are you getting the 20watts, check mike gain not power out gain.

If you put the radio in fsk mode, key with the send button, the rig go to 100Watts????

also, try a differnnt mike???

Scott, we now know what you have to measure with. Now, when in CW mode, you say you get 100 watts. When you are trying to measure your SSB mode output, are you talking into the mike, whistling into the mike, just letting the mike sit on the desk, or what?

My point is that average power output for my TS-850 in SSB mode is about 20 watts for normal speech. A whistle pushes the average power up while I'm whistling. Switching my Bird to PEAK mode gives me 80-110 watts with the same kind of speech patterns.

Maybe your new (new to you) radio is working as designed -- SSB should have zero out when nothing goes into the microphone!

Scott, Into a dummy load, crank up the power and mic gain and whistle, yell, or whatever and see if it will read 100 watts. If it will, then the rig is putting out 100 watts. You may not want to go on the air like that but it does tell you how the power out meter behaves. Bob WE6C

I havent checked ALC. I am whistling as loud as I can. One thing I did notice is that on 10m output is near 50w. As I go up through the bands it gets lower to where its only 20w on 160m. I am doing this all into my kw dummy load. SWR's are just barely over 1. Radio worked fine at first, the longer I used it the worse it got. I have tried adjusting all knobs (mic gain, power) to no avail. I dont have another 8 pin mic to try. All my other kenwood rigs (TS-830s, TS-530s, TS-700s, and TS-600) are all 4 pin.

9303. Help please

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-29 09:19:30 UTC
From: Paul
Topic: 9303 Message: 9303

Hi,

I need to buy two Mini-Circuits type PSC-2-1 power splitters.
The cheapest I could get from the States is here:

http://www.alltronics.com/cgi-bin/item/PSC_2_1/search/Mini-Circuits-PSC-2-1

But they are claiming $30 for postage, which is ridiculous. I have received complete kits from the States to Malta with postage ranging from $3.90 to $12.

I am looking for a kind heart from the States, who can order it for me.

Thanks
Paul
9H1FQ

9304. Loss of 6db attenuator

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-05-31 03:01:42 UTC
From: n8nma
Topic: 9304 Message: 9304

Hello, well not sure when or how but my 6db attenuator on my TS-850S has stopped working. Shuts the receive completely off. The 12db one works as it should. Anyone know of this or know a fix ?

Thanks

Tom

9305. looking for TS-450S part

I had this problem with one of my attenuators. One resister in the attenuator went open and another increased resistance. Grab the schematic and check find the attenuators.

9308. TS850SAT FSK Not Working

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-04 16:44:56 UTC
From: w8aks
Topic: 9308 Message: 9308

Bought an Rigblaster Plus in order to run FSK; however have ran into a problem. I am configured for the 850SAt.

I get a steady tone (no shift) on transmit. I shorted the tip and sleeve on the end of the cable coming from the 850. It remains a steady carrier, indicating no shift coming from the 850.

Any ideas on what can be causing this problem, so I can start looking and correct the problem (if simole) or else Clif may have another 850SAT to work on <grin>

Thanks and 73

are you running the fsk into the jack on the rear of the radio or the mike jack....

what happens when you type text, while the tone is on.... does it send the rtty

Hi Dave,
I am using the rtty phono plug on the back of the 850.

I just typed some text while the tone was on. No difference in the tone. It is not shifting tones.

I dont have mine setup for fsk here, but I think you still need audio from sound card to radio... rtty jack is only for the keying fsk mode..

thats probably why I use afsk via the 13 pin plug on rear of radio. it was easier

I took the cover off and the txd led is blinking. The macro with my call is printing on the screen. The software is MMTTY,, naturally. If I can get this to work, the rest will fall into place. I tried shorting the cable coming from the rtty (phono) plug on the 850. The tones did not change. I'm thinking that something in the fsk end of the 850 may be bad. But wanted to talk to some other users before I jumped to conclusions.

Thanks for your help, appreciate it.

try the K0BX website....Joe has a lot of info on there about the 850 and
FSK...there are several menu settings that need set correctly...I know it
sounds simple, but you have the rig in RTTY mode, and the rig is going in
transmit, right?
when you tried shorting the cable, you had the transmit button pushed in?

I'll check out Joe's site. To answer your questions, 1. The rig was in rtty mode and it is transmitting. 2. Yes, the transmit button was pushed in and the rig was in transmit when I shorted the cable.

I know sometimes the simple things are the cause and overlooked; I guess what I'm trying to say is dont feel like I'm upset when you point out the obvious things. I really appreciate the help I get.

Marty,
Check the MMTTY program goto options then the TX tab is the Diddle checked LTR? And the correct Com Port? Then check the Misc tab is the TX Port COM-TxD (fsk) checked? that is how mine is setup using the TS-850 and a home brew interface.

if the TXD light on the rigblaster is flashing when in transmit, then the software is correct, it's something between the rigblaster or the rig....

if the TXD led is flashing on the rigblaster, then the software is set correctly; sounds like something between the rigblaster or the rig....did you check the cable for continuity?

Good Morning Roland,
Checked all the below boxes and everything is ok on the software end. I checked the led's in the rigblaster and it is keying fine. I shorted the cable coming from fsk plug on the 850 and the tones do not change, so I surmising something is wrong in the 859 itself. I haven't changed out the cable , that is next on the list. Other than that, I'm at my wit's end. I dont have the foggiest idea of what to do inside the 850sat , if the problem is in there.

Thanks for your help

73 and Alhoa
Marty
W8AKS (EX KH6HPF)

Marty,
Check the MMTTY program goto options then the TX tab is the Diddle checked LTR? And the correct Com Port? Then check the Misc tab is the TX Port COM-TxD (fsk) checked? that is how mine is setup using the TS-850 and a home brew interface.

9321. TS 850 using SignaLinkUSB - very little SSB signal out?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-06 04:12:48 UTC
From: nz6p_mike
Topic: 9321 Message: 9321

I am confused about the setup for SignaLink USB sound card device connected with #SLCAB13K cable to the 13 pin ACC 2 connector on the 850. I get very little power output when in USB(SSB). If I switch to FSK mode on the 850 I get full power (RF Gain up full and CAR about 10 o'clock position)regardless of what I place the TX control on the SignaLink at.

So, what is going on here? Please help if you can.

Thanks, ..mike NZ6P

check your sound card output to see if it is at full volume settings, and also the signallink , my sl1+ has volume settings internally to set, maybe the usb version does as well

Dave

The SignaLink has an internal jumper that boosts the TX audio to a max of 2Vp-p which seemed to help a lot. I still don't get the ALC on the 850's meter to register anything, but I can get a full power out reading now. So I must be closer. Band condx have been so poor I haven't even been able to detect a digital signal yet.

Yes first check your sound card level it should be max(that's why the interface has a volume control for TX). Also Make sure you you do not over drive the audio check the ALC. To set up your SL USB see pages 4-5 in the manual. Also check your Jumpers on JP1 make sure that Pin 1 goes to MIC. If you TX audio is still low first try the Mic gain on the radio if still to low connect JP3 Also if your RX audio is low as mine was Jumper JP2 needs to be connected as the Audio out from the radio is at a fixed level. I have been using the Signalink USB for a couple of years now and find it a great interface.

The data input on ACC2 requires nominally 20mv to develop power out. You need to double check the connections and make sure it's wired correctly. The mic gain does not affect the input on the rear panel, the drive level is set by the sound card output level.

Hello,
first message to group,
I'm new TS 850S owner, (6 months)
2 days ago i was working dx for 1 hour,
gone to eat something.. didn't turn of the radio
come back to station and i saw full scale receive (9 + 60) and no rx...
i turned off the radio, turned on back (without antenna) in the s metre, i saw,
7-8 signal and to 9+60 quickly.. and no receive.
it was like i turn on or turn off the rf gain pot...

i turned off the radio for 10 minutes, than turned on again,
no problem. finished..

started to work dx, when making QSO problem repeated 1 more time for 5 seconds. and
finished..
2-3 hours it didn't repeated any more ..

where i have to check ?
what do you think about ?

Any help is appreciated.

has it still been happening. could be noise in neighbourhood, causing high signal levels.

could it be a neighbour playing tricks on you with carrier????

try checking connections on rf gain control, see if its dirty, try cleaning the control

is you NB on, maybe noise is popping in and out as it finds how

Thanks, Cliff. That is what I thought as well. I will check the cable again, but something weird is happending, I know. First, with the additional boost in the sound card output (SignaLink says it is as much as 2v) I can drive the 850 okay. But the weird thing is that the mic gain DOES change the output level, just as much as changing the RF power knob. I wonder if a PO changed some wiring somewhere. I will verify that the sound card ouput goes to pin 11 on ACC2.

This is a puzzler.

Hey Clif, my mike gain does effect the input to the radio via the 13 pin
connector, it is a FIXED output there,not input. rf power acts as a max
output, with the mic gain setting it for reduced output (30 watts or so on
rtty, and psk) if I desire

Same with mine Dave. Has been that way since I hooked it up 2 years ago.

Dave and All,

Same here... the mic gain position DOES affect audio drive levels. I just leave the 850's mic gain just above the 9:00 o'clock position (the same position as my SSB usage level), and adjust the SignaLink USB's TX pot for an audio level that's just below the AGC bar graph indicating anything whatsoever.

That way, when I switch to SSB, it's one less thing I have to change or worry about when switching modes. In fact, I only re-engage the RF processor "PROC" switch when going back to SSB, as I normally run about 3 to 6 dB of compression on SSB (the processor is OFF for digital modes).

One more thing... I run my SignaLink soundcard volume level at about three-quarters, which keeps my SignaLink's TX audio level pot at about 10:30 o'clock. If I run the soundcard level at full-bore (100%) my SignaLink USB's TX audio level pot sits around 8:00, or near the minimum of range (most attenuation).

All is copacetic here!

Thanks, Cliff. That is what I thought as well. I will check the cable again, but something weird is happending, I know. First, with the additional boost in the sound card output (SignaLink says it is as much as 2v) I can drive the 850 okay. But the weird thing is that the mic gain DOES change the output level, just as much as changing the RF power knob. I wonder if a PO changed some wiring somewhere. I will verify that the sound card ouput goes to pin 11 on ACC2.

This is a puzzler.

9337. some crackling noise on receive

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-11 09:20:19 UTC
From: Allan
Topic: 9321 Message: 9337

Hi all,

Since some weeks , I have some crackling noise on receive on my ts-850.
First that happened when I switch on the transceiver and after about 10
minutes, it will stop but now it's all the time.

Filters off, antenna disconnect, volume off , crackling noise still here (
about signal 3 on s-meter)

Any suggestions for resolve this problem ?

Many thanks

Regards

Allan

Mike - The mic gain on the front panel should control the TXA level when using the 13-pin accessory plug in the back. There is also a pot inside the radio for establishing a base line level of some sort but few folks have to get in there and mess with that. So you have four controls that affect the PO on SSB/AFSK modes.

Possibilities are

The internal pot mentioned above
Mic gain on front panel
Sound card setting in the computer Sound Card and Audio Devices
TXA level on external sound card, (i.e.) Signalink TX

Shoot for not more than 50w with zero ALC action.

Okay, Bud, what you have written so succinctly makes good sense with what I have observed. I am sure I can work the setup correctly now. I am usually on CW, but thought I would give BPSK and RTTY a try. I believe I am good to go now. Thanks to all who provided input.

Hi Dave,

Many thanks for your reply. I don't see any difference with or without filters.

Maybe that comes from my power supply (Ps-52), I was in contest this week-end and after some hours of transmissions, a guy told me that my modulation was not good like a problem of power supply. So I replace it, and I don't listen for the moment the crackling in receive on my 850.

I will see in future days ...

Regards

Allan

9347. Electrolytics - again

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-14 11:36:46 UTC
From: villy.madsen
Topic: 9347 Message: 9347

I did a couple of mods to the TS850sat this weekend,

added an RFC in parallel with the surge protector, mod for the CW monitor tone & for the cw keying lines.

Noticed that there was one electrolytic on the board that was a brownish red in color instead of blue.

Is this an indication of a bad electrolytic or were different colors of electrolytic capacitors used ??

Thanks

Villy ve6sq

9348. Re: TS-450 low output on ssb

Topic: 9295 Message: 9348

Just wanted to let you know what the problem was. I sent it out to N1EQ. He found an electrolytic had leaked out over 2 of the ceramic filters causing it to transmit double sideband. I should have it back on wednesday. Scott

>
> I havent checked ALC. I am whistling as loud as I can. One thing I did notice is that on 10m output is near 50w. As I go up through the bands it gets lower to where its only 20w on 160m. I am doing this all into my kw dummy load. SWR's are just barely over 1. Radio worked fine at first, the longer I used it the worse it got. I have tried adjusting all knobs (mic gain, power) to no avail. I dont have another 8 pin mic to try. All my other kenwood rigs (TS-830s, TS-530s, TS-700s, and TS-600) are all 4 pin.

9349. TS850 no RX ot TX audio

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-14 16:48:12 UTC
From: Patrick Egloff
Topic: 9349 Message: 9349

Hi All,

A friend of mine has a TS850 that has no RX and TX audio.

He has something on the ACC2 connector in RX and TX does key.

Any guess on what can be wrong before we dig into the service manual ?

73, Patrick

1) is it safe to key a SB200 directly from the TS850 or do I need some type of interface? If directly is OK, does the relay switch need to be "on"?
2) has anyone used a Timewave DSP599zx or the ANC-4 noise canceller with the TS850?

9353. TS-850S receiver muting

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-14 21:19:00 UTC
From: kdrosenlund
Topic: 9353 Message: 9353

I'm looking for a way to mute the receiver in my 850 while using it with a vintage transmitter, a Johnson Ranger.

Does anyone know if the ACC 2 jack has that option? I have one of those plugs. What about the ACC3 jack? I have no info on that one.

Any help appreciated!

all jacks are mentioned (wiring and function) in the manuals, but i dont remember anything other than a relay contacts for an amp, or auxillary connections, sound card, dsp100, etc..

are you using a separate antenna as well???

If it has 12Vdc or less on the amp relay then it will be fine if not 12Vdc then use a interface or foot swtich.

I will be using the same antenna. I'm building a little external T/R switch for the Johnson which will ground the receiver antenna on transmit, do you think that would be enough, or would the receiver front end still be at risk? Thanks.

You'll have to go the old t/r route and switch the speaker in and out also...the old DowKey relays had additional switches for this....73...Jordan....

Hi Dave,

I should have been more precise...

With NO connectors attached :
- no RX audio on headphone or loudspeacker
- RX is OK on pin 3 of ACC2

- TX does key when PTT
- no audio in any mode with mike

pin 3 is fixed audio, so it is receiving, it appears., but i would suspect some obvious things to check

on RX, maybe af gain turned down, rf gain turned down too far (where is s meter). did you try an external speaker, are attenuators working

on TX moni turned on, mike gain up, processor OFF,

can you try digital modes, and do they work ok.

how is the mike, have you verified on another radio, or with an alternate mike???

9364. AT-850 Tuner Install Question

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-20 02:57:20 UTC
From: Crownhaven
Topic: 9364 Message: 9364

Trying to get an AT-850 into a TS-850S. Instructions pretty vague. I am seeing an RF cable in the radio running from the external antenna connector (appears to be named CN5) to CN2. It looks like they want you to unplug this cable at CN2 on the radio and plug in the cable from the tuner. They then appear to want you to run the RF cable from CN5 to the connector also marked CN2 on the ANTENNA TUNER itself. Makes sense to me.

However, there is absolutely no way that the cable that is on the radio is going to reach from CN5 or the antenna connector to the CN2 plug on the tuner.

Anyone run into this? Do I understand this correctly. Do I need a longer cable? Where does one find one if that is the case?

Regards,

Steve, N4JQQ

Hi all,

Way back in 1997, I managed to download a free handbook, from Kenwood in Italy, called Kenwood RTX Manual. It has a goldmine of fault finding information about many of the first Kenwood syntetised radios like TS850, TS440 TS940 etc, with some pages missing, but still worthwile. I am unable to upload it here as it exceeds 5Mbs.
However, I have set up a temp email address, and whoever wants a copy, I can email him a copy. Send your request to the following email address: malti at inbox dot com

Does anyone know where I can find a replacement Molex jack for ACC 3?
One of the clips broke off and it just flops around.
I would also like to find the male jack so I can build an auto tuner cable for later.

i am from Argentina LU9HA
my TS450 transmits and receives in the two sidebands at the same time
that may be
I also seem to be deaf in 20/15 and 10 meters because they did not hear anyone

regards

I can't remember the place that you plug all the cables but yes you will need a longer cable. I was lucky and had a friend that had one from a TS440 that he took the tuner out of. You could make one if you had to with the ends from the existing one.
Hope that helps.

Tom

Trying to get an AT-850 into a TS-850S. Instructions pretty vague. I am seeing an RF cable in the radio running from the external antenna connector (appears to be named CN5) to CN2. It looks like they want you to unplug this cable at CN2 on the radio and plug in the cable from the tuner. They then appear to want you to run the RF cable from CN5 to the connector also marked CN2 on the ANTENNA TUNER itself. Makes sense to me.

However, there is absolutely no way that the cable that is on the radio is going to reach from CN5 or the antenna connector to the CN2 plug on the tuner.

Anyone run into this? Do I understand this correctly. Do I need a longer cable? Where does one find one if that is the case?

Regards,

Steve, N4JQQ

Steve

You will need the longer cable. I purchased one from WA4WIP (he sells parts for TS-430 & 440's) on QTH.Com. Contact him and describe the cable and give him the length needed. To me it was the easiest and cheapest way to go. You can also place an ad looking for the cable. Hope this helps!

9373. Re: IF-232 Interface Alternative

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-21 23:52:25 UTC
From: Carl
Topic: 8158 Message: 9373

I looked in the file section and found some info about the IF-232C like Schematic diagram for the IF-232C (PCB PN X57-1170-00)

Isolation between TTL 6 pin DIN connector and RS-232C DB25 connectors-using opto-isolator IC3 TLP521-4

Line Driver IC1 SN75188N and Line receiver IC2 SN75189N connected to DB25.

and 5 volt IC4 NJM78L05A, +12 volt D1 MZT12J and -12 Volt (IC5, Q1, Q2, D2 etc) power supplies.

Then I went to

http://www.hosenose.com/detail.asp?product_id=LCU-3K

The LCU-3K has 2 connectors with wires (with a MAX232 ???) but where is the power supply??

Carl

>i am from Argentina LU9HA
>my TS450 transmits and receives in the two sidebands at the same time
>that may be
>I also seem to be deaf in 20/15 and 10 meters because they did not hear anyone

I fixed a similar problem some time ago... you need to check electrolytics in the main circuit as some of them leak, destroying and shorting traces and PCB vias (connections between top and bottom layers). I have some pictures at home and can forward them if needed.

What happens is that instead of selecting the SSB filter, due to the damage, a wider filter is selected so SSB is not properly filtered and you transmit and receive is DSB (Double Side Band)

Hope this helps!

Best regards,

JOSE

>as usual, I heard nothing

Well, it seems to me as an unrelated problem (but perhaps I am wrong as I have worked only in a couple 450s but lots of 850s)

I would check, using the schematics/block diagram, which are the items that are only working on 20/15 and 10 meters. I guess there is a VCO only for these bands... if so, I would carefully check and align it.

In general, in these cases, a good reading of the Service Manual is both instructive and productive :-)

Regards,

JOSE

Dear all,

I have done some magic ;-) and now you can download most of the pages of the fantastic Kenwood RTX manual (thanks Paul!) on its original format (TIF files), in higher resolution and with cleaner pages:

http://jvgavila.com/man_ham/rtx/rtx_manual.htm

There are some pages missing (20, 21, 22, 23, 25, 35 and 36) but you can use the full PDF manual for them (available at http://jvgavila.com/man_ham.htm)

I am working to find the missing pages...

Best regards,

JOSE

I also recently purchased the "LCU-3k" cable with built in interface for the computer serial port (RS-232). I use it with the Ham Radio Deluxe software.

I have attempted to interface both of my TS-850s while using the DSP-100. I connected the DIN plug to the CONT OUT connector of the DSP-100. It appears that the LCU-3K is not compatible with the TS-850 / DSP-100 combo.

My old Kenwood IF-232C successfully interfaces with the DSP-100.

I would appreciate any recommendations to get the LUC-3K to interface with the DSP-100.

From: Crownhaven
Topic: 9390 Message: 9390

I have an almost new LDG KT-100 auto tuner for sale. This is the tuner developed for the TS-850S/450S. It is a small unit, outboard, and allows you to have an auto tune capability in a radio that does not have the Kenwood factory tuner. It is operated like the internal tuner by pushing the AT Tune button on the front of the radio. It is a nice tuner, very small. $150.00 plus shipping.

I haven't seen a scan of the service manual that is this high resolution
or low compression. Seems worth keeping around.

I renamed the files so that they sort properly in windows. I also
changed it from a .rar to a .zip file, since most any windows or mac
user is probably already setup for .zip files.

I posted this file to my web server. No crazy German, no passwords.

9403. AM transmit audio sounds lousy

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-06-30 04:28:52 UTC
From: kdrosenlund
Topic: 9403 Message: 9403

Hi All,

I have a nice TS-850S that works great on SSB, and FM, but not well at all on AM TX. It's a 3 mil serial number, and has the INRAD filters added, plus I've done some published mods for improved audio. The AM receive is fine.

The AM TX audio is distorted. When I turn the power out down, it gets somewhat better but is still lousy. Also I notice the power out level swing down noticeably when I modulate.

Any ideas? I have the service manual, but it doesn't seem to have any alignment adjustments for the AM TX mode. I don't use AM mode often, but would like to once in a while.

Thanks for any help in advance.

-Kit

I dont think there is anything wrong with the radio, just the way you are using it on AM.

These radios only generate AM by re-introducing the carrier into the balanced modulator. To get good sounding audio you must turn the power o/p setting so that if the radio runs say 100 watts o/p on FM or SSB, you need to set the carrier control so it only gives about 40-50 watts for good linearity(50 watts carrier and 25 watts each sideband. By running the rig at full power there is no headroom for the mod peaks, hence distortion and negative dips on the meter.

As you have found, turning the power down improves the audio. On my TS-450S, I put the rig on AM into dummy load, turn carrier up to ALC point and set power out at 100 watts. Then I turn the carrier control down to abot 40 watts and get good audio,with a slight UPWARD kick on the meter, not as good as a plain old fashioned rig with plate modulation!

Andy,

Thanks for the reply. This radio sounds so great on SSB and FM that I was expecting it to be better. The power output swings down on modulation on any power setting, even all the way down. It gets a little better with the power turned down to about 25 watts. When trying it with my AL-811 linear amp, it sounds bad at any setting, so that's out of the question.

Guess I'll have to wait till I get my Johnson Ranger project finished for good AM TX.

Thanks,
Kit

Have you adjusted it "By the Manual"??? It works.

Here's how you adjust the 850 for decent ops:

1. Select AM mode and 6 KHz filters.
2. Initially turn down fully the "MIC" gain pot control.
2. Turn the RF "PWR" pot control fully clockwise.
3. Key up or transmit into a dummy load on band desired.
4. Adjust the "CAR" control for a maximum AM carrier of 20 to 25 watts.
5. Adjust your "MIC" gain control upward from zero while speaking normally, for a minimal ALC deflection. With minimal ALC deflection, you should see the RF power output meter modulating upward when speaking.

You're done... now operate.

The 450/690/850 series were designed with 100 Watt Peak Envelope Power (PEP) linear power amplifiers -- not 125, 150, or 200 Watt amps. To keep an AM signal clean and faithfully reproducing audio input on AM, we need to operate the final RF amp within its designed linear range of 100 Watts PEP. To do this, the RF carrier level must be kept at 25 watts or lower, for a 100% modulated AM carrier. A 25 Watt carrier that is fully modulated (100%), presents a PEP output that is 4 times that of the carrier output (100 Watts). Higher carrier levels, when modulated anywhere near fully, will exceed the linear range of the rig's RF power amplifier for the average amateur user. It's just this simple.

73.

Kit,

Reference my 850 setup email just sent for proper AM setup.

Now that you're operating with a AL-811, I'll take that into account. Remember that a fully modulated AM carrier's PEP power level is 4 TIMES the the unmodulated carrier. So, adjust your 850's "CAR" downward below 25 Watts to say 10 or 12 Watts.

Why? Because your AL-811 amp has 3 811A tubes that'll amplify your signal about 10 dB -- a power amplification factor of 10 TIMES. 10 or 12 Watts multiplied by 10X equals 100 to 120 Watts carrier. Now, fully modulate that 100 to 120 Watt amplified carrier by 4 TIMES (100% possible modulation), and you have 400 to 480 Watts -- just within the linear operation range of the AL-811's amplifier. Don't op the radio/amplifier combination at levels exceeding this...

Besides, the 811A tubes in your amp won't stand the heat generated from AM operation for very long. I wouldn't key down for very long in the AM mode... speaking from experience here (I owned an AL-811H amp, and op'ed it on AM for a short time w/ my 850. I was careful, and still came close to overheating and over-stressing that thing). This AL-811 series of amps isn't designed for AM ops...

So, there you have it.

A problem has developed with my 850,lets say i am listening at 14.275 if i move the setting of either of the slope tune controls by the slightest of movement i lose the rx audio i was listening to,go to move the vfo and the frequency has dropped exactly 20 kcs,also i notice that sometimes when i key the mic.to tx it will drop the exact 20 kcs,leaking caps were replaced on display board and also on the carrier board by the way it has the new dds chips.any help appreciated

sounds to me you are NOT centred on the frequency, so the slope tuning is causing you to find the operator...which could very well be 20kcs away... what filters do you have, maybe they are the narrow filter sn-1, and you are going too narrow???

is your rit or xit turned ON????

Dave,re your response,i will be listening on 14.275 for maybe 10 mins. or so everything is ok if i accidently key the transmitter or touch the vfo i lose the audio i was listening to on 14 .275 ,some of the times just on keying the tx 14.255 will show on the readout other times just a slight move of the vfo it will show that i am now listening 20 kcs down. this all started to happen after the we found leaking caps and replaced them on both the display and carrier boards.

Hello!

>double check the leaky caps did not destroy the traces....

AND carefully clean between IC pins, using a toothbrush and some
alcohol. Capacitor residue IS conductive.

Good luck!

Everything was pointing to the DDS ic's until you said the display changed to 14.255 from 14.275. The only thing that can make the display change is the processor, not the car unit, dds chips, or anything else, processor only. And it and the radio changed because something told it to.

I would start on the control board looking behind the battery for signs of leakage. Several data lines run under the battery and corrosion can cause strange things. From what you are saying the radio is actually changing frequency by 20 kHz and that goes back to the processor. If the radio changed but the display didn't then I would go to the Car unit.

VERY GOOD!!!. I had not thought about that leaky batteries. In my
TS-790 they were a real PITA, as you can see in my WEB page (below)
and the BLOG entries listed at the end of the WEB page:

http://jvgavila.com/ts790.htm

As you can see, it is not always easy to spot the tiny damage they
can cause, specially on PCB vias.

Regards,

JOSE

9417. Adding IF out jack to TS-450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-07-10 00:08:24 UTC
From: Scott
Topic: 9417 Message: 9417

Just wondering if anyone knows how to add an IF out jack to a 450? I have a SM-220 for my TS-830s and it shows in the monitors manual how to add a jack to a TS-530s. Does anyone know if one can be added to a 450S and maybe how to do it? Dont really want to go up to an 850 since I just got the 450 all fixed up. Thanks, Scott

The DSP 2 jack is the 4th IF @ 36.891kHz

In order to activate the DSP2 output, you have to enter in the radio's adjustment mode by holding down: POWER+SCAN+XIT+AIP. Once in adjustment mode, choose menu #14 and turn it to "ON" using the DOWN/UP keys.

A simple down converter can be built to shift the frequency to the SM-220.

Optionally, look at the service manual schematics and find a tap point on the IF board. Run a shielded cable from here to an open area on the rear and terminate into a connector of your choice.

Thanks for the info, I want to run an LP-PAN with the TS-450 so I will need to get it down to 8.83 MHz. Scott

Hi Scott,

The short answer is no. The frequency scheme for the TS450 is different than my TS850.

While both rigs are triple conversion (1st IF = 73.05 MHz, 2nd IF = 8.83 MHz, 3rd IF = 455 KHz), the TS450 doesn't give you any easy way to get any wideband signal past the "roofing filter" in the 1st IF. Sure, you can tap into the output of the 2nd mixer but you'll be limited to the bandwidth of MC3 in the 1st IF (refer to Page 12 in the Service Manual).

What's different about the TS850? It has to do with the noise blanker circuit. The 850 taps off of the 1st IF ahead of the filter, mixes it down to 8.83 MHz, and then does the noise blanking. This also gives us a convenient place to connect our Panadapter/Bandscope. It's also NOT in the AGC loop - AGC action from strong signals in the passband will cause your Panadapter display to pump downward in level. You don't want that. The TS450 doesn't have this extra mixer circuit. If you tap off the 2nd IF (ahead of the 8.83 MHz filter), you'll see only what the roofing filter will let you see... probably about +/- 10KHz. I wish I had better news for you!

73,
Bryan WA7PRC

9422. Parts needed for TS-450s

I am looking for a part for the TS-450s. the mic gain switch broken shaft and need to repair it. Looking at the service book page 113 it shows that part number is X41-317 D/5 .

This seem to be a group of (4) four switches. The group number on page 113 of the manual is 200 I am also looking for the C/5 pot or switch.

This radio was used at our field day and fell and broke the shaft of the mic gain plus jammed the top right pot making it hard to operate (not sure what this pot does because I don't have it in my possession). It belongs to a member in the club and we are trying to repair it for him.

We need your help in finding these switches and pot.

Thanks 73s

Wayne Alley K4MGE

Hello Everyone - Here is my first post to the list. I am the second owner of a like-new TS-450S/AT that will arrive next week. I am interested in opinions and experiences using this radio for CW. Not contesting but, just good performance for a casual brass pounder.

My 'new' 450 replaces the TS-570D/G I sold last week. I decided to digress to the 450 because I just got bored and needed a change. :) I have owned a TS-440 and TS-530 in my time and enjoyed both of them. Thanks ahead of time for your comments and experiences.

Hi Paul

I have 2 TS-450SAT's here and I really like them. I have all the filter slots filled, which makes it even a better rig. I do about 75% CW ahd 20% RTTY and maybe 5% SSB. I have full computer control of both rigs and it works great!

I have the 250 cycle Inrad filter in 1 radio and the Kenwood 500 cycle filter in the other. If you were to purchase filters, I'd definately go with the Inrad over the Kenwood. My 500 Kenwood filter says 500 cycles, but I'll bet it's closer to 6 or 700 cycles wide.

In short, I really like my '450's. I have a FT-450 and if I can unload that radio, I'll probably get another TS-450 or 690. 73

Paul,

I acquired a TS-450SAT a few months ago and love it. My other main rig is a TS-820S. I work primarily CW but am not an avid DXer or contester. I found early on that I needed to add a CW filter since the rig came with none. Based on a QST product review from some years ago, I opted for the 500Hz filter for the 8.3kHz IF. I found it either on eBay or QRZ for $100 including shipping. Now I could not be happier. Enjoy.

9431. off topic TS-790E problem (PLL on startup)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-07-22 09:20:46 UTC
From: vojtech
Topic: 9431 Message: 9431

Hello Group,
I have the TS-790E, using it from time to time for AMSAT satelite QSOs. I have some time before mentioned a problem with 23cm module, where after setting on the display there were only points and audio muted. What is interesting, that after few minutes, when I push power on/off button, it starts to work and stays hours. I suspect some VCO getting out from range, but the problem disappeared so fast, that there was no chance to open the radio and measure it.
Last time after maybe 2 months period standing I have mentioned this 23cm dots again, but a next error- an unclear CW signal on 70cm, although in this case display was okay, it seems like a sidebands around the main carrier.
The second day after this awakness the radio started on all bands without problems. Maybe some electrolytics get formed???

I would like to ask somebody here (who had the TS-790), if there are similar issues with electrolytic caps and so on, which should be replaced or revised, because this radio is sure in the age of TS-850.

I will be happy for any info,

OK1VAW, Vojtech, Prague.

I don't have much operating time on either rig, but have owned both. Happy with both, but the FT-990 was AC only, and therefore not easily useable at Field Day on battery. TS is a bit smaller than the FT, both have all the knobs and switches instead of hidden menus, a plus for me. Both has an auto antenna tuner, and the FT can be had with a DC input to make them equivalent. Either rig is great at home, easy to use without the manual. If you are choosing between them, flip a coin! Enjoy!

I have both in my shack. The TS-850 I have had since new in 1993, and the FT-990
I bought new, still boxed, last year (sat in someones closet all the years)

In my opinion, both of these rigs are excellent - possibly the two best mid-range rigs
from the 90's, that are still very competitive today. In fact the TS-850 is a favorite
amongst the audiophiles that strive for the best sounding audio.

I really would be hard pressed to choose between the two...

I preferred my TS-850SAT to a new TS-950SD I bought, then sold......and
I prefer my FT-990 AC/DC to it's big brother FT-1000D that I also have.

The 850 IMO has better sounding TX audio, the 990 is more versatile operating on 12v
or on 110v (850 only operates on 12v), both have excellent ATU's built-in....better than
the
current new rigs, I prefer the 990's old BIG analogue style meter to the 850's bar
graph.....
it's a tossup between the two.

9435. LDG KT-100 Tuner For TS-850S/450S/690S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-07-24 11:47:38 UTC
From: Crownhaven
Topic: 9435 Message: 9435

I have an LDG KT-100 tuner for sale. It is a tuner developed by LDG to specifically interface with a Kenwood radio. The tuner is operated from the front panel of your Kenwood. It works great if you have a radio without the internal tuner and want an auto-tuner. I used this one until I replaced it with the internal tuner on my TS-850S. It is in perfect condition. $150.00.

To get HRD to work you need to select the radio ts-450s baud 4800 parity none and stop bits 1 also check CTS and RTS if your interface cable is working it shoul talk to HRD just fine. Also since yours is a USB make sure you pick the comm port that the computer assigned to the USB interface.

Hi Scott

Did you do the autodetect with HRD as someone else mentioned? Did you get the drivers for the USB adapter? If it sets up a USB comport, you may have to go to device manager and install the software for the serial port. 73

I got the driver for the cable and all. Tried so many things cant remember them all. I ordered a different cable that is serial instead of USB from the fellow in the UK. I am thinking that the cable may be defective. Have to wait now on the slow boat to arrive and cross the fingers.

Good to know - I was about to order the same cable off Ebay for my TS-450S! Did you contact the seller and see if he will take it back or do an exchange?

Any one else have any luck with that cable?

The seller is 'afordableradio' and has a ton of positive feedback, so perhaps you just got a bad one?

Hello

I have sometimes the same with my TS850S but I just go into the controlpanel
delete the new mouse and then unplug the USB and plug it in again
 Best regards

I have have all the settings that should be. I dont know if the usb cable is bad or not. I just figured I would get a serial and try it. Heard some were having troubles with the cable. I dont know how to test the cable anyhow. I will try deleting the mouse and hooking the cable back up once more. I really wish there was a book somewhere for HRD so I could just sit down and read. I hate having to look everything up online. Call me old fashioned I guess. Thanks again, Scott

My TS-850S has the MARS mod. I'm a member. I put an AT-850 tuner in it but the tuner will not tune outside of the amateur bands. My other 850 will tune outside of the amateur bands, anywhere I attempt to use it. What am I doing wrong here??????

Steve, N4JQQ

I notice it will tune outside the amateur bands on some freqs. However,
it will not tune a 4 MHz freq that we use for Navy MARS. Stops tuning
at 3.999.

Thanks

I dug back into the archives and Clif answered this question for me sometime in the past but it was about the 450. My other 850 tunes above 4.000. My second one doesn't. Does anyone out there have the same situation going on?????

Not sure anything can be done about it though.

Steve, N4JQQ

>> Begin archived material <<

The 850 manual shows it switches the same as the 450. The 870 switches at 4.5. Who says Kenwood doesn't listen. Since there are several revisions of the 850 software it could be that the later rev's also switched at 4.5. My SM is an early one and Kenwood doesn't always tell what all they did in the revisions. I've never actually measured it.

Clif Holland KA5IPF
www.avvid.com

At exactly 4.000.000 mHz the 450 tuner switches to the 40m configuration which is optimized for 7.150.000. That's why it will tune at 3.999.999 and not at 4.000.000

Look at the Eprom, it could be you need a later version. The 850 has several versions.

Are you using a serial to usb adapter or a cable that has a usb
connection? I got a converter cable from G4ZLP that didn't work.

No adapter. Just a usb cable. Got a serial cable on the way. The usb cable is actually locking up my computer so I removed it.

Hi Scott

Sometimes it helps if you go into control panel/hardware/device manager and click om the USB controller list. Right click 'USB hub', click properties and open the power management tab. Make sure that the 'Allow computer to turn off the device to save power' box is not checked. If it is not used for a while, it will shut down and can lock up the computer. 73

I also got a bad cable, anyone know the pinouts, so I can troubleshoot what's wrong with the cable? Don't want to order another serial cable, I should be able to ring it out if I had what the pinout is on the DB9. Thanks, David

Not being familiar with the cables everyone is talking about I have a question. Do they have the level conversion in them? The 450 puts out TTL data and the computer RS-232. They are not compatible. For that reason you can't do an ohmmeter check for continuity.

9461. TS-450 Intermittent signal problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-07-31 19:55:03 UTC
From: Paul
Topic: 9461 Message: 9461

Recently I purchased a used TS-450S/AT that I have had for about two weeks. The last couple of days I am having an intermittent signal problem. I can be listening to a station in any mode and the audio will cut out sounding like the squelch kicked in but, the indication on the S-Meter also shows zero when that happens.

I have discovered that a light tap on the radio brings the signal and sound back for anywhere from a couple of seconds to several minutes then, it happens again. I did discover that a light pressure pushing the front panel in causes the signal to come back and as long as I press on the front panel, anywhere, it functions as it is supposed to.

My thoughts are that there is a loose connection somewhere or possible a broken wire somewhere or a ground that may not be firm. So, if anyone has had experience with such a problem or can advise on what to look for, that would be very helpful. I am reluctant to open up the radio to work on it since I know nothing about troubleshooting solid state gear and have not done any troubleshooting in many years. I may have to do so if I intend on keeping the radio or I can probably return it and get my $$$ refunded.... I'd rather have the radio and have it working properly. Thanks ahead of time for help....

Hi,
I know other TS-690 owners have had this problem. Can anyone tell me what components (capacitors) had to be replaced to correct problem. I have low recieve on all bands and low power out on SSB. FM and FSK has normal full power output. All knob settings for SSB operation have been set according to operation manual. Capacitors on IF and Carrier boards look okay.
KD6PPM

Topic: 9464 Message: 9465

my450 was doing the same. Check to see if it is transmitting double sideband. A cap on the if board leaked out over a couple of the filters and was causing it to transmit double sideband.

Wiggle the coax jack on the back. Sometimes the wire going from the jack to the board comes loose and has to be resoldered. 73

Thanks to those who offered suggestions on my problem. I checked the coax connector and it's internal lead and it is fine. I did discover an anomaly that I can't explain but, seems to have solved the problem.

I unplugged the SP-23 speaker to pull the radio out and check inside. When I did, the 'cutting out' symptoms stopped. However, I discovered that moving the speaker cable around and putting just a slight pressure on the plug would cause the cutting-out to recur. After checking the coax connection, putting the covers back on and plugging in the speaker, I cannot get the cutting-out problem to manifest itself again. Pressing and tapping on the radio have no effect. So, I am suspecting there may have been something going on with the speaker jack. What doesn't make sense is that the signal level drops off as well when it cuts out so, I am still left with a mystery. I have been listening and tuning the radio all afternoon on most bands and it has functioned flawlessly since I found the speaker plug connection. So, who knows. If and when it occurs again, I will go directly to the speaker jack next time the radio is opened and check all around that area.

The schematic doesnt state that this inductor is different from any other 1mh fixed inductor on the board, so i would think any 1mh fixed inductor would do....even if it does come from a C.B,

9472. TS-450S - Need the display unit

Yahoo group: TS-850_450_690 (2010 — 2016)

From: CISCO GEEK
Topic: 9474 Message: 9474

Just to add to the many posts about the user settings published on the Internet, about the TS-450 S/AT

We already know the four bootup functions: found in the service manual pages 42 & 43

1. Push Power-up + USB/LSB = Extended menu items 1-30

2. Push Power-up + M.IN key = Extended menu items 31-42

3. Push Power-up + Enter key = Filters and A.T. on/off menu items 1-4

4. Push Power-up + CLR + ENT = Full reset to factory defaults takes place

AND, the point of this post is to publish the following additional info.

Adjustment Functions menu items

5. Push Power-up + AIP + XIT + SCAN key = Transceiver adjustment mode. Menu Items 1-17 (found in the service manual on page 44). Keep in mind that after each toggle or adjustment in the adjustment mode, you must execute item #17, which is an EEPROM write, confirmation of the write to EEPROM will be a single beep, then proceed to the next item, writing to EEPROM each time any toggle or change is made.

Credit for items 1-4, couldn't be located, but NOT ME!! If anyone knows who originally posted the information on mods.dk <http://mods.dk/view.php?ArticleId=730> site please publish kudos to him or her. [:D]

Hello, my name is Miro, SP2QOT. Thanks for letting me join the group.

Since I have been using "new" transceiver TS-850S, and noticed the following symptoms.

1)Too high level noise floor (broad band, white noise) generated after the 3rd IF filter. Noise is added continuously to the desired signal. I can hear it when RF Gain knob set 5 (12o'clock) position. It easy to notice wihout 500Hz 455kHz filter.
When RF Gain knob set on 0 (7 oclock) the noise disappears. In normal operation, when rotate RFgain from 10 to 0, i can notice,first attenuated 1st stage IF amplifier (with desire signal) and later next stage IF amp, and finally the last stage IF amp(RFgain knob 0). I also have a TS-450S that does not have these symptoms.

2) After turn on NOTCH filter, increase noise floor about 18db (also wideband noise). Notch works very efective, but the noise is tiring after a long time.The increase in noise level also in this case is most noticeable when the RF gain knob is set to 5

Any idea whats can be wrong? Or it is a normal?

Miro

It's a 276.00 dollar repair at Kenwood East. VCO#5 and or #2 on the IF board is most likely "out of lock" meaning that it is lower than the 5.0 VDC required, you will find that when the VCO is out of lock, it will display dots on the display rather than digits.

Lots of information on the Web about this known issue.

I don't have a 450 but I had this come up with my 440. In the case of the 440 they used a contact cement to hold most of the components down on the VCO boards. The stuff absorbs moisture, discolors and becomes conductive as it ages. I spent a couple weekends removing all the affetced components, scraping the glue off and putting them back on the boards. I had to replace a couple that had corroded leads due to the glue.

It only cost me a few dollars but occupied maybe 20 hours of time.

Hello -
I've been away from HF for about 2 years and was wondering what the current outlook is for TS-850 parts. I see that Cliff at AVID is still providing his great service.....but what about parts...are we pretty much down to having one "parts" radio to keep anoither active TS-85o running or are there still some parts sources out there. I'm looking at getting another TS-850 is the reason I am asking. Kind regards to all and 73 de NZ7C

Joel, you might try this first before adjusting anything. It fixed my father-in-laws 450 & it is still working after 1 1/2 year.

I sprayed freon, cool it in can, on the 8.375 Mhz crystal on the CAR board & rig started working.

9485. TS-440, Please Help!!!! Dots my TS-450s display

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-09 18:09:01 UTC
From: Montgomery, David R Civ HQ 754 ELSG/DOX
Topic: 9476 Message: 9485

Joel,

Try this link. http://www.mods.dk/index.php?ModelId=521&RadioRec=kenwood
Look at the article dated 08-12-2003 or 12-09-2007, for the Kenwood TS-440 S/AT. (More links at bottom of email)

Like the gentleman said earlier, it's the glue that Kenwood used to stabilize the VCO (voltage controlled oscillator) on the IF (intermediate frequency) board. Kenwood engineers apparently determined to be a requirement. Basing that decision on the fact that transceiver can be used in a mobile (bumpy) environment.

This glue hardens and becomes conductive over the years and causes leakage (conductive is a better word) from component to component, and thusly causing voltage variations, manifesting itself in the PLL (phase lock loop) circuit in which the PLL will not lock-up (normal voltage required for this PLL to lock-up is 5 volts DC) which in turn, causes dots to be displayed on the front display rather than digits.

The fix as stated earlier, is to carefully remove the components of the VCO from the IF board, VCO#5. Remove the glue, clean, dry and serviceable. Then, to re-solder. (As shown in the aforementioned articles.

My transceiver was sent to Kenwood for the repair, and others are lucky enough to have the time to fix.

Lessons learned in this DIY (do it yourself) job is that, some people either break the resistors when lifting them from the copper trace (circuit board) or the actual leads are corroded and break off, regardless of which one, if any, problem is realized, some folks have to buy new components which are obtainable at your local electronic store who should carry the basic generic parts which should have the same electrical values.

Take care, KJ4WKL-- David Montgomery

(The comments above are only my opinion; I take responsibility for nothing!)

Having just gone thru this drill less than a month ago, go to Pacific Parts and buy the new board. It is in stock and costs $10.31 . There is very detailed instructions on replacing it. It takes about a half hr to do .

It is well worth it.

Thank you for the replies. I asked because the replacement boards seem to fail quickly. I have been looking online and some last 6 months some last 6 years. I dont want to buy a 10 dollar part that i gotta keep 6 of them in stock because they are junk. Not to metion the time lost when the rig is down for repair.

Brian

Aloha Brian,

I replaced mine with a new one 5 years ago and have not had a problem since. I did order 3 of them since at the time I had 2 850's so I have 2 left over just in case. I you have been having the boards fail it might be somteing else going on with the radio not the replacement boards. The way I figure it is I have spent $2 a year so far to keep my 850 up and running thats less than a medium coffee at starbucks.

I've never had to replace one of the replacement boards. Where did you get your information?

As a side note the 850 is sensitive to voltage drops, at least the DC/DC board is. If it starts getting flaky go over all your power connections and tighten them up, replace the aisan fuses, tighten the connector on the back of the radio. I can make the board malfunction by dropping the voltage to around 11-12v. And guess when the most voltage drop occurs???

Before you change out the board - If you look in our files section under "Modifications", there is a section called "DC-DC Converter" which states "Change R2 and R3 to 18K for more reliable -6 volts to ALC circuits. DE K0ZL(SK)." I did that 4 years ago and the problem went away and has not yet returned.

I put 2 18 ohm carbon film resistors in place of r2 and r3 put it back together and i get a pinned alc and 50 watts out on cw. I am guessing they have to be smd resistors?

The board doesn't care if they are SM or leaded. It does care about the value. 18 is a long way from 18,000.

check to see if filter selection is maybe set to the wrong one, or too narrow. which audio, voice, or cw....

do you have any sound card software connected , using hamscope or similar. check , you should have full spectrum showing, if not then a filter is on

just my thoughts...

What board are you working on? The radio will TX without the converter board, all it does is provide a reference voltage used in rx and tx for the AGC/ALC circuits.

You need to buy the replacement board before your radio quits working altogether or something else is damaged.

I have a TS-850 which was hit by a proximity lightning. over two years ago. Unemployed and scratching to get by on early Social Security. I did not get the radio to Bill Leahy K0ZL (SK) before he passed.

O n the RF Unit X44-3120-00 there is a Diode D31 (as per TS-850 repair page)
which was a MI204 but suggests Two LFB01's.

Pacific parts has almost nothing left.

The East coast Kenwood parts has the LFB01's for $.41 each with a minimum.

Bill did not used MI204's and did not do the LFB01 change.

What are my options on parts and where to get them.

Al K0FRP

Cliff
Thank you for putting up with my boneheaded quest here..
Yes I agree. I have stopped using the rig. Just hooked up the meter and now I get -12 volts on the 6 volt output. That would explain why the alc is pinned forward. I should have just got a replacement in the first place. I like to fix things, but sometimes ya just gotta buy a replacement! Hi HI!!

it sounds like one of two things to me, maybe others in the group can
listen, but I seem to have something like that just in the air, but th
enoise blanker takes it out, so it is "in the air" so to speak

OR

Jose, maybe you can confirm, q49 can cause that static discharge type
noise....

9541. TS850 losing lock

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-18 17:19:40 UTC
From: k7cu
Topic: 9541 Message: 9541

My TS850 suddenly wouldn't hold the lock from 30 meters up to 10 meters. It works fine on 40 down to 160. I sent it to a repair facility and they are running the radio on 20m and, of course, it's working just fine. This originally happened last Feb 2010, was repaired, and it worked until July when the problem manifested itself again. Now it seems to work and isn't failing...yet. Any ideas??

9553. TS-850 speech processor not working

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-22 19:31:03 UTC
From: Kit
Topic: 9553 Message: 9553

Hi,

Has anyone had experience with speech processor malfunctions in the TS-850?

Recently, mine quit working. While listening with headphones in Monitor mode, turning the speech processor on reduces the mic audio level. I can still hear it though, and it does sound different, but the level is way down, even when turned up to max. I don't see any adjustment for it in the service manual.

It's a nice feature to have, but I know it's on a tiny board with SMC parts, and looks like an expensive fix.

thanks,
Kit

9554. TS-850 Dead on receive

Yahoo group: TS-850_450_690 (2010 — 2016)

From: n8nma
Topic: 9554 Message: 9554

Hello, I am working on a TS-850 2 mil serial number with a dead receiver. What happened to it is that some sort of voltage spike came into it from and amplifier when the tube in the amp went bad. I have checked the filter unit B3 and even replaced the caps on the RAT line. D16 seems to be fine. I saw something in the post about D31 and checked the RXB which gave me a reading of .97 volts. Does this mean that I need to replace D31 ? And where do I go from here ?

Thanks

Tom N8NMA

Yep, that indicates D31 is shorted. Remove it and check the RXB, if 8v all is well. Put in a MI204 and go on. It's not surface mount but much heavier duty.

9559. External Auto Tuner TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-24 15:53:03 UTC
From: alan7114p
Topic: 9559 Message: 9559

I have been trying to mate my TS-850SAT with an Icom AH-4 Auto Tuner. I use a long wire and the internal tuner will not match the high SWR of the long wire. I have successfully used the AH-4 with an external circuit to start tuning. I want to use the internal tune function in the rig to control it, such as would be done with a Kenwood AT-300.

I have switched the switch on the back of the rig from Internal to External. I added the 'gimmick' capacitor and resistor suggested by N2MU (specifically a non-polarized 4.7uF cap and 3k ohm resistor in series connected across pins #2 and #5 of the connector on the rear of the radio). I set the THRU/AUTO switch to AUTO. Then I made all the connections shown by N2MU to the AH-4.

When I push the AT TUNE button the radio beeps and goes to transmit for a fraction of a second and then returns to receive. I know that both lines 2 and 5 are going low (I can see dips on my o-scope; but I'm a beginning scope user and I can't say what the timing sequence is; maybe someone can explain to me how to look at this?).

Does anyone here have any idea why this does not work.

Thanks and 73 de Alan K6ZY

Oh, and one more thing: what is the function of the 'gimmick' cap and resistor? Seems like maybe it's to add a time constant(?), but why?

Alan, I don't know what kind of scope you have, but if you can trigger it externally, trigger on one signal and look at the other to get the time relationship between them. If you have a dual-trace scope, you can trigger on one signal and look at both of them.

My Pan Adapter suddenly stopped working with my TS-850 the other day. I suspect that I'm not getting anything out of the IF jack on my radio anymore.

Anyone know if this is a known issue?

I've checked the jack where it's soldered to the board, doesn't seem to be anything as simple as that. There is what looks like a relay right next to the jack. Is there some way to turn the IF Jack on and off that I'm not aware of?

So this power supply is powering my TS-450, What is happening is that when I dead key I get 14 amps draw, on the PS Meter, but when I modulate, the currents declines to 10 or so, even in a dummy load. The watts output also declines. Question is: Do I have a problem with the regulator portion of the PS or is this normal behavior?

Thanks, Dave

Hi Dave

I had the same problem with an RS-20 and it turned out that the screws that held the filter caps to the board were loose. Tightend them up and it quit tripping the radio off.

The TS-450 doesn't like low voltage. It will chirp like mad!! 73

Help me to understand exactly your statement. When you dead key it you draw 14 amps, I assume you mean CW but when you "modulate" it drops to 10? Are you using SSB?? Then you would need a peak reading watt meter. The amp meter in the PS would not show as much in SSB load as CW.

Dave,

You are describing normal behavior for SSB vs CW at the same peak power levels.

CW, key down, is constant (say) 100 watts, drawing 14 amps in your case.

SSB "modulated" is incredibly variable, with only PEAK power being 100 watts, and average power being something like 20-40 watts depending on your voice, microphone, gain settings, audio processing, etc.) This will need much less current to feed the transmitter.

This same idea is why you have to watch the temperature when transmitting RTTY, which is higher than real CW -- because CW is dots and dashes and spaces.

ALL, Let me re-word the conditions

When on AM...during(unmodulated) a view the PS's Amp meter, the external wattmeter, I see 14 AMPS and 100 watts respectivly. However when I modulate- on AM, I see all the meters listed above, Decline to 10 Amps, and 60 watts respectivly.

This issue occurs weather at 100 watts or 10 watts output, given the same conditions above WRT the MODE.

I guess I could hook up the 12 VDC power from my Truck, and isolate the PS, but am looking for some experts, WRT the crowbar circuit on the Astron RS-35 Power supply- If Im even on the right track.

So, is this enough details, or did I miss the mark hi hi

First of all the TS-450 is NOT I repete NOT to be run at 100W on AM it is 25W max. Since you are a Technician why are you running AM??? See how the radio works in SSB if the conditions you decribe still continue then use a multimeter and mesure the output voltage of the power supply in receive and transmit. If the voltage drops in transmit then one of the pass transistors is failing.One other thing to check is the power cord fuses & holders for corrison ect. The reason you see the 100W on key down and 60 on modulation is because of overload of the final section. Refer to the operator manual for proper adjustment for AM use.

Yes I checked the cable for continuity. Today I connected the antenna jack of my TS-450 to the IF output of my TS-850. Tuned the 450 to 8.83MHz and I hear nothing but static.

Anyone know how I would go about troubleshooting this?

9573. TS-450S + Rigblaster Plug & Play, simple?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-26 21:12:28 UTC
From: Raymond
Topic: 9573 Message: 9573

New Kenwood owner here.

I'm getting a TS-450S and intend to use it with a Rigblaster Plug & Play I already have for my Yaesu FT-450. If I read the West Mountain website correctly all I need to interface the PnP is the RPA_K31D adapter cable.

What I'm confused about is the cable description says it only controls PTT on pin 9. Does that mean it doesn't pass the audio in/out and I need seperate cables? Or is West Mountain's description supposed to instead mean that the cable doesn't support CAT operation (which I don't need anyway since I like fiddling with knobs and buttons)?

I would ask them, BUT some kenwoods need pin 13 for ptt, using pin 9, with
diode to pin 13 will do the same.......

does it wire to the 13 pin plug, or mike jack...

Good to hear your problem is solved. When C187 failed in my TS-850,
there was a low-level rumble in the audio and a strong odor from the
capacitor as well.

While I had the board out, I also replaced C167, 182, & 184, all associated
with the audio amp.

Alan, KD5R

Been a long time since I took this off the shelf, couldn't stand the sight of it!

But, getting low on broken stuff, so thought I would take another stab at it.

I think I am close - I can now get it to transmit, and the method is by inserting the CW jack, and/or working a plug into the ACC2 jack. I think that a pin on the ACC2 jack, Pin 9 to be exact, might be shorting. It has the opportunity to key the radio, so I will be taking it apart to see if there is a short.

Anyway, I am using the rig again - and once this is finished, I need to SEE WHY THE VOX DOESN'T WORK! I cannot do semi-break in CW, I must put it into transmit on SEND, and then key the radio which works fine. Voice will not trigger VOX either.

Any VOX DEBUGGING advice out there?

Thanks and 73

9578. TS850 keying a QSK Linear and other questions

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-29 02:57:14 UTC
From: Mario Aviles
Topic: 9578 Message: 9578

Hi Group:

Today I worked my TS850 with an Expert 1KFA linear on 40 meters and it worked great. I have two questions/comments:
(1) The linear is QSK and made the RLY and ALC connections from the REMOTE connection on the TS850 with the Linear AMP switch to ON. I wonder if there is a way to key the linear bypassing the internal relay on the TS850 to avoid the clicking noise.
(2) Is there a way to improve the NB? I had some noise which I would have eliminated very easily with another radio, it seems the NB on my 850 does not work
(3) I have an SDR-IQ receiver which I bought to use as Pan Adaptor. I tried it but for some reason I am getting a signal into the SDR-IQ because there was saturation on the SDRIQ. I connected it to the IF OUT connection on the 850.

Thanks for your help

73´s

Mario/YS1MAE

9579. RX issue on TS-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-29 13:59:07 UTC
From: cintrans
Topic: 9579 Message: 9579

Hi all,

Just joined and i already have a question!
Bought this TS-450s in real nice shape, but when i switch it on when the radio is "cold", the S-meter goes full scale and has muted RX. It takes normally about a half minute or so for the S-meter to come down and RX audio to start comming thru. Once the radio is "warm" all is normal, normal S-meter reading and RX audio. Switching it off and shortly there after on again does not show the problem (as long as the radio is "warm"
I changed the C104 cap in the speaker line already and cleaned up that general area (removed components to get there!!) found a "MAO" trace on the IF board open that i fixed, as far as i can measure RFG, AGC and ALC voltage are good. Cant find any suspecious electrolytes on thr RF / IF board that might cause this "unwanted RF gain / AGC control"
Any advise or inside into this would be highly appreciated....

73's de P43A, Jean-Pierre

PS. A few months ago someone on the board here had the same issue, but he did not get a fix for this so far either....

9580. Re: RX issue on TS-450

Look closely at the AGC line. You will find that when the S-meter is maxed out the AGC voltage is zero or close to it. It's usually a leaking cap and the goop has damaged/shorted traces as you found. Try looking under the Murata 455 filters.

9581. RE: [TS-850_450_690] Re: No IF Output

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-08-30 15:43:19 UTC
From: James Sutherland
Topic: 9563 Message: 9581

That is what started this. My pan adaptor stopped working on my 850. The only way I know to test the IF output on the 850 is to connect another radio to it.

I spent most of last night looking at the circuit diagram of the RF board. The IF connector is CN7 and I can't, for the life of me, find that connector on that circuit diagram to see exactly what it connects to.

Anyone familiar with the RF board circuit diagram on the 850 want to point me in the correct direction?

-James

does the pana dapter work on the 850????

it should be the same IF, i think

Try Q14, buffer amp, and Q15, mixer. They amplify and mix the first IF (73.05) down to 8.83 for the IF out plug on the back.

Hi Clif,

Your right, checked it again when the radio is cold and i have only about 1.7V on the agc line at CN1 on the IF board, it goes up to about 2.4V when the radio warms up.
I removed the other 2 filters, but not the Murata as i figgerd there was nothing (traces) under that one anyway...
I'll take it out this week-end and see what i can find... any other caps in particular for the agc i should look into?

Usually the problem is under the 2 small filters. Now you just have to figure out where the voltage is being drained off because of leaking cap juice.

9590. Using the Processor stops transmit audio TS850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-02 02:22:38 UTC
From: n8nma
Topic: 9590 Message: 9590

I have an 850 with an 8 mil serial number and whenever I use the processor it stops the transmit audio. Does not do it all the time, but after a few minutes of using it. Turn it off and audio is back. I was looking at the schematic and the board in the radio. It looks like a transistor near the processor board may be at fault. However the board and the board diagram from the service manual match, but the schematic does not. It says it is Q8 which is a 3SK131(M). Which it is not. It has the markings 24 with a line and then 07 diagnally. The schematic shows a four legged transistor and this is a 3 legged one. Any one know what the value or part number is for this?

Tom N8NMA

9591. 8 mil serial number ts850 service manual

Well it appears that many things in the 8 mil 850 don't match the service manual I have. Works fine with my 6 mil radio. Proc audio out and attenuator out also....have to look around I guess. Anyone else run into this ?

Thanks
Tom

9592. Re:: TS-450 STILL Won't Key

Well, it was just like before - worked perfectly for 3 days, and then POOF, back into a stubborn mode of NO TRANSMIT. The CW key, ACC slot was just a false indication, as now regardless of what I do, it again has fallen mute.

I am beginning to really suspect the VOX circuit, since the VOX is inoperable, it could be malfunctioning and tell the microprocessor that it is in transmit on startup? I need to fix it anyway, so I am going to start focusing on that part of the radio.

Could someone advise me if the TS-450 work with the VOX module completely removed from the radio? If not, I will be advising the list!

Thanks for listening!

Hi Dave

No, the radio does not key with the VOX in either SSB or CW, so it is totally disfunctional. I get the sidetone, and when the radio will switch into transmit by using the SEND button (which is seldom) the radio does transmit CW. So, I need to troubleshoot the VOX circuit, and maybe I will get lucky and find the problem with the radio thinking it's in transmit when it is first powered on.

I will learn 2 things when I finally figure out this radio's problem - 1 is the problem, the other is PATIENCE! It's trying mine right now hihi.

Thanks for the thought!

9595. Need help with TS-450 repair

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-07 17:35:01 UTC
From: Raymond
Topic: 9595 Message: 9595

I don't get audio out of my TS-450 anymore. I get signal out of the ACC2 data port but nothing out of the speaker or ext. speaker jack. I opened it up and the C104 brown capacitor leaked dielectric goo on the PCB board. I'd like to repair it but this will my first attempt at doing anything inside the radio so I'd like some guidance.

1) How do I take the IF board out? There are two ribbon cables but I don't know how they come off. They are connected to the IF board with some kind of black clip (don't know what they are called). Do the ribbon cables slide out of the plastic or is the plastic clip supposed to be pulled off the board?

2) What's the best solution to clean the PCB board without damaging it?

3) If replacing the cap doesn't work and I don't see any obvious damage to the PCB traces I suppose I need to look at the last amp upc2002v (IC5). I think it's out of production as I can't find a datasheet online for it. What's the best replacement, LT383? TDA2002? TDA2003?

4) I'm not very skilled with a soldering iron. If I have to replace the IC, would it be acceptable to bypass it with a daughter board? I see Vellman sells a very small audio amp kit (K4001) based on the TDA2003 that should fit inside the case.

Thanks for any help,
Ray KJ6AMF

OK so the Q8 is there, it is on the other side of the board right under the other transistor.
Guess I just need to look better next time.

9597. Pitch of CW set to 400 or 800 Hz or some where in between?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-08 17:35:34 UTC
From: Carl
Topic: 9597 Message: 9597

I seem to be using CW mode more and more thx to SKCC and would like to know more about Zero Beating to the 800 Hz side tone. I had posted
message# 1780 on Jan 7, 2004, but this time I made some measurements. I know how to zero beat the received cw signal with the 800 Hz side tone. But I still don't fully understand Page 53 of the TS-450S instruction manual programmable function # 40

"The pitch during CW reception can be set anywhere in the range of 400
to 800 Hz in 50 Hz steps." With the Initial State at 800.

I think that this has something to do with changing the BFO offset frequency only, as the pitch of the side tone can't be changed from 800 Hz .

With my Kenwood TS-450S tuned to W1AW (@ 14.04750 MHz Ref QST W1AW code transmissions), I zero beat below and above W1AW (center frequency):

800 Hz Offset Zero Beat with 800Hz side tone Key Down (VOX OFF)

14.04759 MHz and 14.04916 MHz with 14.04838 MHz Center Frequency about
800 Hz from W1AW

and

400 Hz Offset Zero Beat with 800Hz side tone Key Down (VOX OFF)

14.04719 MHz and 14.04876 MHz with 14.04798 MHz Center Frequency about
400 Hz from W1AW

I know that I can't go below an offset of 400 Hz but if it was zero Hz the center frequency would be nearly 14.04750 MHz ???

So what is better 800 or 400 Hz? What are the pros and cons of those settings?

Topic: 9598 Message: 9598

Well, the TS-450S is transmitting for the moment, so while it is in this good mood, I thought I would tackle the VOX issue. Perhaps there is a common problem?

I began by tracing audio with the scope. I have audio on the CN6 pin 4 direct from the microphone, and I have adjustable audio on Pin 9 of the VOX unit, the V24 adjusts it's amplitude, so this means Q73 is working. So far, so good. I am puzzled that the pins 1 and 2 are contantly 'high', measuring 7.5v regardless of the vox settings. Not sure this is right?

I switched to tracking down CW (my main desire to see why the CKY line was never going high, or 'active'. Following the circuit description for CKY on page 25 of the service manual, all was well until until trying to get through IC11(1/4). I am getting a high signal on pin 2 when keying the key, but nothing on Pin 1, which talks to pin 6 the BK-IN module. That, in turn, turns on the CKY line I believe. Does this means I have a BAD IC?

So, biggest question is: are pins 1 and 2 on the VOX unit supposed to be high ALL the time? And, is there any way to determine of IC11 is bad, and can it be replaced?!?!?!

Thanks group

-Kevin K7ZS

Hmmm...maybe the first list of frequencies was a little confusing, here is another example:

Station K0XYZ is sending CW @ 14.05000 MHz

I hear K0XYZ and zero beat with K0XYZ at the fallowing frequencies:

800 Hz Offset Zero Beat with 800 Hz side tone Key Down (VOX OFF)
14.05000 MHz and 14.0516 MHz with 14.05080 MHz Center Frequency

or

400 Hz Offset Zero Beat with 800 Hz side tone Key Down (VOX OFF)
14.04960 MHz and 14.05120 MHz with 14.05040 MHz Center Frequency

I don't know...I seem to be getting more and more confused about
was is going on here.

I'll take a stab at this... If you put the rig in LSB, tune in a cw signal so you hear the tone, tune up in frequency and as soon as you no longer hear the tone, you are now at zero beat, the same RX freq as the TX freq. You then put the rig in CW mode and you will hear the CW tone at the freq of the offset you have set (400 or 800 what ever you have it set at). You can do the oposite in USB by tuning above the zero beat freq. In your example you should be at 14.050. The station at the other end should be doing the same thing and both stations should be at 14.050. He will hear his tone at whatever offset freq he has his set at. Hope this helps.   Bob WE6C

I answered 1 of my own questions:

Pin 1 of IC11 does go HIGH with a CW key closure, and keys the radio ONLY WHEN the STANDBY SWITCH is in SEND. So, this all points back to the VOX board and Q55. The VOX board putting HIGH on pins 1 and 2 all the time, regardless of the button position. AND, Q55 does not seem to be conducting to put IC12 pin 9 into a HIGH state, which in turn hits DELAY board pin 3, which after the proper delay turns on Q53 which grounds the SS line, keying the rig. Sounds like Q55 is first to verify, but why is the VOX high all the time?

I almost think I understand how this works, now to find the bad part!

9603. RX Problem with TS690

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-10 06:59:19 UTC
From: Mansueto Grech
Topic: 9603 Message: 9603

Hi All,
I have a TS-690 for some time now and recently I noticed that the S-Meter starts to go full scale within 5 sec of switch on and the gain is greatly reduced. Same as if I have close the RF gain to give you an idea of the effect. After 30 minutes everything returns to normal.

This only happens on the 6M Band. HF is fine.

I believe it's an AGC problem but what puzzles me is the fact that the effect is on the 6M band only.

Have anyone encountered this problem before before I put my hand in it.

Thank you in advance for any help and assistance.
73's
Mans. 9H1GB]

BTW I have the 50W version.

9604. Re: [TS-850_450_690] Re: Pitch of CW set to 400 or 800 Hz or some where in between?

Maybe. Between USB and LSB you can find zero beat between the tones. On an 850 you can use the "tune" button to find this zero beat position. Bob WE6C

Not the first time I've gotten something backwards! LOL! Sometimes I will switch from CW to CW-R and when the tone is exactly the same, then you are at zero beat. It's important to zero beat a CW sig. If you don't, and the sending station has his narrow filters on, then your answer may be out of his passband and he will never hear you. Bob WE6C

9606. TS-450S Loss of receiver audio.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-14 15:27:45 UTC
From: VO1HP
Topic: 9606 Message: 9606

A friends TS-450SAT has lost rx audio. S Meter still moving so rx is working OK but can't hear anything in headphones or internal speaker or external speaker. When problem first happened there was low level audio in speaker by turning vol control all the way clockwise.

In an attempt to resolve the situation for him I removed the top cover and then the speaker and also the metal bracket that holds the speaker. I tightened various circuit board mounting screws that I could see without further dissassembly. When the speaker was reinstalled and also the top cover the audio had now disappeared totally!....

Have no service manual so if anyone can forward an e-copy it would be appreciated. If anyone can point to a typical problem to go look for I can have a shot at it.

My friend is 90 years young and his rig is his main preoccupation so we need to get him back on the air as soon as possible !

Tom

Thanks for the link to the instruction manual. I have a copy of that book and now also have the service manual thanks to someone else on the list.

Frank, simple things first, have you tried an outboard speaker or headphones on the 450s? Try that first. Then we can go from there.

I had a pal one time that has a new 2 meter rig that lost its audio. He sent it back to Kenwood 2 times and called them the next time. They said it worked perfect when it left there. Make a long story short, he had it mounted in a box with an outboard speaker. The outboard speaker was no good.

I had this problem with a TS-430 that had been used on a sail boat and had a dirty contact.. When you removed the headphones the contacts were corroded and did not reconnect and send the audio to built in speaker or remote. I had to swab out the headphone jack with contact cleaner. Jack is closed in back and could not clean out from inside the rig. I don□t know if 450 is the same but worth a try.

Frank, that sounds like the TS820s I have. It had no audio when I got it. I bought it off Ebay knowing that it was that way.

I tried the wiring at the external speaker jack and the headphone jack and got nothing. However, like you say with yours, the S meter was working. So I knew I was down to the audio output stage. It had the audio output chip out of it. I luckily got a replacement from a place in Georgia and that fixed it. Can you find the audio output on the schematic and check some voltages around there?

I haven't looked at the 450s schematic but I will. Anyone else got some ideas for Frank, chime in.

Go to the IF unit. Locate the 455 IF filters. Beside them is C104, a brown electrolytic cap. It has leaked and damaged the PCB. It is in line with the output of the audio amp and goes to L12 right beside it. The trace from C104 to L12 is on the top of the board and most likely the one damaged.

9617. TS 690S AGC / no receive audio problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-17 02:32:41 UTC
From: Alex
Topic: 9617 Message: 9617

Dear all

I have a TS 690 with full scale S meter/ no audio problem.
I did found out on the IF board the c104 capacitor already leak, i replaced it with a 440uF temporarily (original its 470uF) but still i have full scale meter and no audio. Also i measured the AGC line i got a 1.9volts reading based on the service manual it should be 3 volts.

My question is
1) Does the leaked capacitor had effect on the AGC line voltage?
2) Sorry i cant find the C104 and L12 on the diagram, what is its function?
3)Should i remove the 455 filter and check if it was damage by the leak?
4) What other points to check ,specially on the IF board.

Hope someone can give me a tip, the forum help me a lot how to approach the problem speacially Clif's technical answers about full scale meter problem. Hope he can give a clue to me, also other forum members who already repaired and solve this problem.

Thank you,
Alex

9619. Re: TS 690S AGC / no receive audio problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-17 20:20:24 UTC
From: avvidclif
Topic: 9617 Message: 9619

Did you clean the board when you replaced C104?

The electrolytic is conductive and can short lines to grouns as well as eat traces. The AGC line runs by where the leaking cap was, start looking closely at the board for contamination. Sometimes I have had to remove the 455 filters and clean under them.

Also check for other leaking caps on the board.

Alex

I have / had the same issue on my TS-450,
- You will find C104 & L12 in the top right corner of the IF board diagram near connector CN13
- I changed C104 and got the audio back after the radio warmed up
- When the radio was cold, i had the full scale S meter reading with very low audio allso (seems a common issue..)
- On Clif's advise i removed CF1, 2 & 3 and cleaned up under them, found allso a open trace near the cooling fin of IC5.
- When i started the radio up again, there were only 2 digits that stayed on anymore on the s meter when the radio was cold (went away as the radio heats up). I "adjusted" those away via VR10
- Unfortunatly the front end of the radio is now wide open as i probably damaged the Murata 455 filter when i took it out..... i am still in the process of trying to fix that!!
At least the AF and AGC seem to be working now the way they should...

9621. VOX trouble

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-18 15:59:14 UTC
From: David Montgomery
Topic: 9621 Message: 9621

Need help on my 450. When I enable the VOX it am having trouble. When I modulate, it keys normally, but when I stop modulating, there is a relay in the back of the rig that keeps clicking and I can vary its clicking frequency with the Delay pot of the front. It will never unkey on its own, simply click click click click..

Any one seen this problem before.

Also note, I did adj. the two pots on the side, ANTI and sensitivity, but nothing will fix or stop the relay from clicking on the back of the rig.

Thanks, KJ4WKL

Clif

I have located C104 on the TS450SAt IF board. There is severe leaking. So much that the positive lead has been eaten away from the capacitor. I have successfully removed C104 and the broken lead and cleaned the board. There does not appear to be any permanent damage to the traces on the board. There is discoloration but not eaten away.

I have a 500uf 10V that I could install to replace C104.....is the value of C104 at 470uf 10V critical.?

I have taken pictures during the process if anyone would like to see them.

Thanks for your help

Go to the IF unit. Locate the 455 IF filters. Beside them is C104, a brown electrolytic cap. It has leaked and damaged the PCB. It is in line with the output of the audio amp and goes to L12 right beside it. The trace from C104 to L12 is on the top of the board and most likely the one damaged.

your mike gain may be so high, the mike is picking up up enough to kick in the vox.

turn down the vox gain, increase or decrease the delay. decrease your background noises???

That will do fine. Look closely at the trace on top of the board that goes to L12.

Go to the IF unit. Locate the 455 IF filters. Beside them is C104, a brown electrolytic cap. It has leaked and damaged the PCB. It is in line with the output of the audio amp and goes to L12 right beside it. The trace from C104 to L12 is on the top of the board and most likely the one damaged.

9629. Kenwood TS-850S S Meter Receive Signal Decreases when Radio Warms Up

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-19 22:02:48 UTC
From: k5box
Topic: 9629 Message: 9629

My TS-850S seems to receive just fine [audio volume]and S units look fine untill it warms up[about 20 minutes] then the S units decrease to less than S2 when it started out as a S9.Audio doesn't seem to decrease
Cap leakage somewhere?
Tnx for any trouble shooting hints.
K5box

Rich

Tnx for the nice comment. I try to help him out when he requests it
which is not that often. Just elated that I was able to fix the
problem and get his rig back on the air. I am not a technician so
trouble shooting was out of the question. Its great that these groups
exist where you can go and get help when you need it.

I guess we both got lucky on this one.!...he - in that his rig is fixed
for $0 cost and myself - in that I made it happen for him with expert
from people I don't even know!

Dear All

Thank you for the info for my problem, I already removed and clean the murata filters square black plastic, but still i have full scale on the meter, one improvement i get is i can hear strong Shortwave broadcast station even full scale meter on the 11 Mhz region. Is this a good sign? I didnt remove the steel cased filter though, do i need to check it also or clean? Ill check again for open trace on the board, wish me luck!! Any advise is gladly welcome.

Thank you,
Alex

Hello all,

I´ve the same problem with my TS-450SAT...full scale S-Meter with the radio cold...seems to go back normal as the radio warms up..

There was a C104 leaked too that I replaced and got the audio receive back...but still the S-meter problem.

I will post any news

73

9633. Re: TS 690S AGC / no receive audio problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-20 13:01:36 UTC
From: avvidclif
Topic: 9617 Message: 9633

The S-meter indicates AGC voltage. The higher the S-meter reading the lower the AGC voltage. The AGC voltage controls the gain of the receiver, lower AGC voltage = lower receive due to reduced gain. The S-meter is not the problem, it just tells you what the problem is, low AGC voltage. One more comment about AGC voltage. It is Automatic Gain Control, AGC, it's function is to automatically maintain the gain of the receiver to hold a steady audio level out the speaker. As long as the AGC is working, IE; indicating, then the audio level shouldn't change.

This can be caused by leaking caps which short the AGC line to ground. This is usually accompanied by varying AGC voltage (s-meter reading) because the leaking electrolytic acts like a variable resistor that moves around. It changes value from cold to hot.

When the AGC voltage doesn't change from cold to hot and I have checked the board very carefully for bad/shorted traces caused by a leaking cap, I then check each FET controlled by the AGC and usually find one that is shorted/leaky. Often they respond to a shot of freeze spray. That doesn't fix it, just tells you the FET is leaky and needs to be replaced.

Clif

Hi Gang,

Has anyone tried this:

http://cgi.ebay.com/CAT-interface-cable-Kenwood-TS-690-TS-140-TS-790-TS-450-/180555667233?pt=LH_DefaultDomain_2&hash=item2a09f4d721

I assume that the level conversion is built into the cable.

Thanks,
Mark K2QO

Hmm ... they must cram the conversion chips into that little DSUB-9 plug.

I built my own box using a couple MAX232's and a 7404. It's bigger and
requires a wall wart or other 12 volt supply to power it but it works fine.

I have, and the first one didn't work and then, the second one didn't work. I ended up with this and it works Great! And I got it in two days, verses the afordable radio (ebay) one that you referenced, comes from Canada. took 10 days to get here.

http://hosenose.com/detail.asp?product_id=LCU-3
The LCU-3 and yes, the level conversion is built into the cable. Reccomend the above link for a Good CAT cable.

Cliff

Thank you for the continued tech advice here, its a great help, now i had the 690 receiving but i think its ok when the radio is on for a couple of mins, i think its still a capacitor issue but iam near i know. Ill still continue to replace capacitors.

I still have one issue here, the display contrast is very strong the display is hard to see now, ill view it side view to see the numbers. Is there any display brightness / contrast adjustment for this radio?

Again thank you for all the tech support given by the members,

73,
Alex
DV1TBX

>
> The S-meter indicates AGC voltage. The higher the S-meter reading the lower the AGC voltage. The AGC voltage controls the gain of the receiver, lower AGC voltage = lower receive due to reduced gain. The S-meter is not the problem, it just tells you what the problem is, low AGC voltage. One more comment about AGC voltage. It is Automatic Gain Control, AGC, it's function is to automatically maintain the gain of the receiver to hold a steady audio level out the speaker. As long as the AGC is working, IE; indicating, then the audio level shouldn't change.
>
> This can be caused by leaking caps which short the AGC line to ground. This is usually accompanied by varying AGC voltage (s-meter reading) because the leaking electrolytic acts like a variable resistor that moves around. It changes value from cold to hot.
>
> When the AGC voltage doesn't change from cold to hot and I have checked the board very carefully for bad/shorted traces caused by a leaking cap, I then check each FET controlled by the AGC and usually find one that is shorted/leaky. Often they respond to a shot of freeze spray. That doesn't fix it, just tells you the FET is leaky and needs to be replaced.

Hi,

I have tried the first mention cable but it does not work with me,the seller is cooperative and sent me a 2nd cable, i tried it to interface the TS450 & 690 to Ham Radio Deluxe but no luck for me for both cable, cant find out where the is problem, what i did is i made a home brew interface box and connected it to a serial to USB adapter. It works fine, even in remote operation of HRD.

FYI

The display is lighted by a florescent tube that has probably quit working. Or the other thing I have found is in a smokers shack the cover plate will become covered with smoke residue and cause it to appear dim. From: n8nma
Topic: 9649 Message: 9649

Well my trusty TS850 has developed another problem. The output power on 160,80,40 and 30 meters is fine. But on 20,15,17,12,and 10 meters the output is about half or no power at all. Did a reset with no result. Checked the carrier board and nothing looks bad at this point. Anyone ever have this problem. Tried to do a search in the messages but it does not seem to be working. Any help would be great.

Thanks
Tom N8NMA

Topic: 9649 Message: 9650

Tom, Make sure all your controls are set properly. It's easy to bump something. Are you testing into a dummy load? Is the dummy load a perfect match? RF power and CAR adjustments correct? tuner off? etc etc etc.
The reason I say this is just the other day I go turn on the 850, tune around and find someone calling CQ that I was going to answer. Well it wouldn't transmit! Oh &%#$ what happened??? Well to make a long story short, I looked over at my adjustable power supply and it was at 9.5 volts! I had turned it down to 9+ volts a few days before to check out a small battery table radio and forgot to put it back! It was a sigh of relief tho! Funny now but at first it wasn't so funny! Hope it's something simple. 73, Bob WE6C
PS An 850 will receive fine on 9.5 volts!

Tom, Make sure all your controls are set properly. It's easy to bump something. Are you testing into a dummy load? Is the dummy load a perfect match? RF power and CAR adjustments correct? tuner off? etc etc etc.
The reason I say this is just the other day I go turn on the 850, tune around and find someone calling CQ that I was going to answer. Well it wouldn't transmit! Oh &%#$ what happened??? Well to make a long story short, I looked over at my adjustable power supply and it was at 9.5 volts! I had turned it down to 9+ volts a few days before to check out a small battery table radio and forgot to put it back! It was a sigh of relief tho! Funny now but at first it wasn't so funny! Hope it's something simple. 73, Bob WE6C
PS An 850 will receive fine on 9.5 volts!

Well my trusty TS850 has developed another problem. The output power on 160,80,40 and 30 meters is fine. But on 20,15,17,12,and 10 meters the output is about half or no power at all. Did a reset with no result. Checked the carrier board and nothing looks bad at this point. Anyone ever have this problem. Tried to do a search in the messages but it does not seem to be working. Any help would be great.

Thanks

Tom N8NMA

Hi Tom,
I had similar problems with a friends 850s, after some guidence from Cliff@avvid it was traced to IC1 on the RF board, low voltages on some of the pins confirmed a fault with the chip, got an identical replacement from RS components £1.50 and the radio is working fine now,i hope this is helpful to you.

9654. VFO scanning on 850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-29 00:52:49 UTC
From: kb3ccn
Topic: 9654 Message: 9654

What would cause the 850 to scan through the vfo? I turned on the radio tonight and went to scroll through the bands, but it would not stop.

The best way to describe it, is if I were using the up and down buttons on a desk mic.

I have disconnected the mic cable, reset the microprocessor , made sure my cat control cable was unplugged and it still will not stop.

If I kill the power, and turn it back on , it just resumes.

It is NOT in memory scan mode, or anything I can find out of the ordinary.

Any suggestions ?

Keith
N3QAM

perhaps the scan button on the face (below the number pad) is stuck???

have you added a sound card device, or any other computer interface that could be shorting out. I have done that before... wired incorrectly

I checked the scan button. It is not stuck in programmable scan mode or memory scan mode. No sound card interface hooked up, nor any cables at the moment except for power. I pulled the front panel last night and re-seated all the ribbon cables and checked every connector between the face and the main body. It still does it. The best description of this is like you are jogging the main dial. If I spin the the dial back and forth , I can get it to stop for a bit , until I go to change frequency , then it starts back up again. It will also do the same thing if the dial is changed to a lower frequencies. Then it scans downward.

9658. Antenna tuner in TS850 hangs up or continues to run.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-09-29 14:11:34 UTC
From: n8nma
Topic: 9658 Message: 9658

I saw several postings about this and was wondering if anyone has every found a fix for it. Mine works fine but a local buddy of mine has one that does the same thing. It will tune manually. The motors run although it seems that they are not moving as fast as they should. And if you decrease and then increase the CAR control on the front of the rig you can get it to tune after a while. Once it has a tune position it will retune from memory with no problem. Just wondered if anyone had any luck with this.

Thanks

Tom N8NMA

the tuner needs 10 watts (i think) to run, so if your car level is too low, tuning is also too low to drive the motors correctly.

Also, how is the swr without the tuner, I beleive the internal tuner generally have trouble on over 3 to 1 swr...

I did have an instance where the Knob was off balance on a radio and would cause the vfo to turn, but only until the knob "rested".

HMMM!!

what if you unplug the vfo??? maybe that would indicate the vfo control has an issue

Well he brought the radio over here to look at and I put it on the same antenna as I use my TS850SAT and mine tunes it fine, but his does not. The cap will actually hang up and move back and fourth about an eighth of an inch.
I know about having enough power to make it work. But decreasing the CAR will allow it to stop hanging up and then cycle through.

Check operation of the BPF on the RF unit. You probably have a shorted diode.

Hint: Easy way. Put it on 20m and check the voltages on IC1. Pins 1-3 should be >11v, Pin 4 <1v, Pin 5-7 >11v, 8 is ground, and 9-11 >11v. Any that do not match this have a leaky diode. Refer to the schematic to determine which one.

9664. Need 6631 or 66312 DDS chip

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-03 20:17:52 UTC
From: Jose V. Gavila
Topic: 9664 Message: 9664

Hello!

Well, some time ago I was able to fix a TS-850 thanks to the help of a list member. This time, another 850 has stopped working and I am afraid it has the dread damaged DDS chip failure.

This time, IC2 (in the CAR UNIT), which should generate a 1.625MHz signal, generates about 1.8MHz so, when chopped, does not generate the needed 8.375MHz signal and LO3 signal is unworking. I have resoldered the DDS chip but failure is still present. I have tried to inject a good 1.625MHz signal at the output of the DDS and then rig comes to life, so I know that from that point, CAR UNIT circuitry is OK

So, is there anyone with a 6631 or 66312 DDS to spare?. I would even take an unworking CAR UNIT to salvage one chip.

Thanks for your help!

Regards,

JOSE

The memory battery supplies power to pin 28 of IC3 on the control unit. It should be abt 2.5v with the radio disconnected from the power supply. If it's there the memory IC is probably bad.

After checking Pin 28 and finding zero volts look under the battery for leakage and damaged traces.

Fingers too fast....

HI All

The tuner in my TS-450SAT started acting up and wouldn't tune the antenna like it had before. Now nothing happens when I push the 'tune' button. Just dead.

Where should I start looking? Thanks and 73

Tom W7WHY

On acting up????

On not working period, Have you been in the menu for setting filters? The first selection is tuner off/on. If you turn it on it's for an external tuner and the internal is disabled.

Hi Clif

Boy, I would have never know of that menu function :-) I guess when I installed the filters I switched it on.

But, now the motors will tune, and the SWR goes up and down, but it won't stop tuning. It only gets down to about 2.5:1 then goes back up again. It used to beep after a few seconds of tuning to tell me to turn the tuner off, but now it doesn't beep. Just keeps going up and down without getting a match.

The antenna I'm trying to match is an 80 meter dipole and the SWR is only about 1.5:1 before trying to tune it. I also tried up farther in the band where the SWR is about 3:1 and it won't tune that at all. Also tried the 20 meter beam and wouldn't tune that either. 73

Hi Clif

On 80 it will tune the dummy load OK. When I switch to the antenna and move off frequency to where is is 2:1 or less, it won't tune.

On 40 on the dummy load, it will go down to about 1.4:1, then go back up again. On 20 it goes down to about 1.5:1, then goes back up. Won't find a match.

If I switch to the 40 meter antenna, it will tune it. But, it won't tune the 20 meter antenna. SWR there is only 1.3:1 without tuning.

On the rest of the upper bands, 15 thru 10, it will tune the dummy load OK and stop. Got me puzzled. 73
Tom W7WHY

I would change C1 on the main tuner board, not the one with the coils and relays. Then I would check operation of all the bandswitching relays. Of course, this would be after confirming the data to the tuner unit. Only one line should be high at a time.

Have you checked the CAR UNIT for leaking caps?. Local oscillators generated by that unit could be unstable if the capacitors are leaking. And, eventually, can destroy the DDS chips there due to the short-circuits generated by the leakage. And, by experience (I need one!), those chips are virtually unobtanium.

This would be my first check. Then you could also check VCO-2 as sometimes the trimmer cap gets flaky and causes wobble.

Good luck!

JOSE

Leaky diodes cause low voltages on the IC and they go out a lot more often than the IC's.

I guess it depends on how you want to control it, exclusive, or within a log program

ham radio deluxe, while being very large in size does a nice job, but simpler so does software for the 850 by ve3mij..... it also works, i understand on the ts450 as well

You are in luck. There is a company in the UK that sells a compatible interface both in serial port and USB design for a lot less that what you probably would pay for a real Kenwood IF-232c

ZLP Electronics http://www.g4zlp.co.uk/unified/KenwoodCAT.shtml I think the UK price is 33 pounds. Good luck

When I try to download KMIJ (is this the VE3MIJ software?) from
<http://www.dxzone.com/dx6600/kmij-kenwood-remote-control-for-ts-850-ts-450.html>
I get an invalid zip file error.

Is there a better place to find this? I would really like a control
program for my TS-850 that will run on Win 98 (my old and slow shack
computer). (Available versions of HRD will not run on Win 98)

Well that was what I had thought also. I replaced the chip with a socket also. All is working at this time. I checked the diodes and could not find any fault there but I may have not read them right. If the new chip dies, I guess I will recheck the diodes again or just replace them first.
Thanks a bunch Clif

Leaky diodes cause low voltages on the IC and they go out a lot more often than the IC's.

I think I put the version of Kentrol that I have in the Files section.
It runs fine on Windows 98 - in fact, I used it on that platform for
years. It also runs fine on XP. I haven't tried it on Vista or WIndows
7.

Well, the TS-870S IS very voltage sensitive as I learned before.
Evidently, my Astron crapped out and threw me over to battery back-up.
No way for me to know. The voltage on the storage battery isn't quite
as steady as the Astron. When I moved the rig to a second Astron,
everything started working fine again. Damn!!!!!!!

Clif, you can stand down Sir!!!!!!

Hi folks. Wondering if anyone has seen this problem in an 870. My rig suddenly, no changes in the shack, overnight, started losing audio when I send fast CW at any power over 50 watts. It only does it with dits. If I send fast dashes it doesn't. If I'm sending slower CW, 20 WPM, more or less, it doesn't do it. The audio goes away in the regular chain and in the monitor. I can monitor on another receiver and I'm still sending clean CW. I just can't hear it. Happens when power in rig goes over 50. I'm thinking RFI and I have changed about everything and tried every combination I can think of. Still there. Plus, why only with the dits????????? Full or semi. You name it, I have tried it. Anyone seen anything like this before???????

It seems like some years ago, I had something wierd going on with my other 870 in CW that was due to low voltage coming to the rig. I don't think that is the case here.

Found my problem with the 'corrupted zip files'

Appears that the zip file in question uses an older version of the zip
algorithm that is not compatible with the native unzip software that is
native to Windows XP (pro in my case).

I installed an eval copy of PKZIP and installed it with the downlevel
compatibility. This was able to successfully extract the archive.

Dear group......no where in the manual can I find details of cw side tone settings.It has been mentioned many times in this group.Please can someone tell me how to enable the side tone on my TS 450S?.Many thanks Barrie g4yjs.

Barry, on page 79 it shows the side tone adjustment. It is VR7 under the bottom cover door.

9705. TS-850SAT - how does the mic jack wiring route to the IF board?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-12 19:47:16 UTC
From: w8nf
Topic: 9705 Message: 9705

I have not been able to figure this out from the service manual.

The 8 pin round mic jack on the front panel uses pin 1 for mic audio and pin 7 for the mic audio's shield. I'm trying to determine how long that internal shield wire is before it finally actually is connected to the chassis.

The block diagram suggests that the 8 pin jack is physically attached to the "digital" board. Presuming that's the board behind the front panel, it makes sense. But I cannot find the jack on the schematic for the digital board.

Somehow, that signal from the digital board routes to the IF board - which has an RFI reducing capacitor on it. But that's a long way from the mic jack itself.

Basically, I'm fighting RFI issues with this radio...RF getting into the microphone leads. I'm thinking I've got a massive "pin 1 problem" on my hands. That's where the so-called shield lead for a very low-level signal travels way too far inside the housing before it is connected to the chassis.

Before I go brute force and solder a wire from pin7 to the chassis behind the front panel, I want to figure out how the factory intended it to be done.

I'm making the bold assumption that anybody who services these rigs regularly has figured out the mic wiring inside them.

Thanks!

Good day to everyone. I am Jojo Vicencio, DU1VHY. Just got my hands on a TS-450S yesterday. It is on the table warming up as I do not know how long it has been resting. Cosmetically clean. Even the faceplate does not show any scratch at all.

I look forward to sharing the joys, problems and other concerns that owners of the rig go through. For now, I am happy with it and look forward to using this. My only concern is that it seems the manuals for this radio is unavailable on the net.

73,

jojo

Page 179 of the service manual, far right side, shows the mic jack mounted on a PCB (B/4) of the SW unit. The top two wires are labeled Mic and M Gnd are shown to go to the IF Unit A/5 CN22 which is on the left edge of page 154 (IF Unit schematic).

I would suggest not doing what you are thinking unless you want to cause more problems. The problem is going to be external to the radio as long as Pin 7 shows continuity to ground.

What problems might I cause by fixing a "pin 1 problem?".

As you probably know, a shield isn't a shield unless the shield ties to the chassis of the device in a very short path. Any common-mode RF picked up on a cable entering a box that's not tied to chassis at the point of entry, then becomes re-radiated inside the box.

The "pin1problem" is so common in pro audio that the engineers who are trying to get industry to stop creating the problem have created a website about it.

http://pin1problem.com

There are links in that website to specific papers from the Journal of the Audio Engineering Society describing the theory.

I'm game to look at other solutions, certainly, but so far, my experiments tell me that the fundamental RFI issue in the '850 is that the shield of the mic input cable travels too far inside the radio before connecting to ground. Thus, inside the rig, it's a transmit antenna.

At present, I'm "fixing" the problem by penetrating the front panel paint and pressing a wire there, tied to mic shield. I'd like to fix the problem in a prettier way ;)

But, if you believe that other problems will be caused, I'd like to hear them.

Date: 2010-10-14 15:13:56 UTC
From: Two-Way
Topic: 9714 Message: 9714

Hello Everyone. I am a new member, and repair tech. I have recently been trying to solve a problem with an 850 that has me stumped. And, yes I have searched the forum high and low for this problem.

I have repaired the DDS board and all surface mount caps. The radio works fine after a complete alignment, VCO/PLL RF/IF and the works.
Out the door it goes.

2 hours later the chap says that the tuner doesn't work??

When I get it back, sure enough, there is NO RF output in AM/FM or CW BUT SSB is just fine punching 120Watts into the service monitor.

I have been through the alignment process several times. It just completely quit out of the blue BUT only on all modes except SSB???

Any ideas on this one please, and if I did miss a post outlining the problems, apologies and please direct me to it.

Thanks.

Clif, Just to confirm, multiple grounds which can be at different potentials. Is that a close enuff explanation? I read once in a while on a forum about hams having several grounds and wonder why they don't have a ground loop problem??? Bob WE6C

I have never had that problem with my 850.

As a suggestion, check first that all the grounding screws on the pc boards
are tight. I'll usually go around the board, loosening each a quarter turn
and then tightening up again.

Hello Everyone. I am a new member, and repair tech. I have recently been trying to solve a problem with an 850 that has me stumped. And, yes I have searched the forum high and low for this problem.

I have repaired the DDS board and all surface mount caps. The radio works fine after a complete alignment, VCO/PLL RF/IF and the works.
Out the door it goes.

2 hours later the chap says that the tuner doesn't work??

When I get it back, sure enough, there is NO RF output in AM/FM or CW BUT SSB is just fine punching 120Watts into the service monitor.

I have been through the alignment process several times. It just completely quit out of the blue BUT only on all modes except SSB???

Any ideas on this one please, and if I did miss a post outlining the problems, apologies and please direct me to it.

Thanks.

not sure about the 450, but I do beleive the 850 requires a stereo plug,
even though the mono wiring, tip and sleeve, leaving the center conductor
empty

From: Dave ve3wej
Topic: 9705 Message: 9719

catching up on messages, and maybe I missed something, but what is this pin 1 problem. i did not see anyone ask about what microphone is being used, is there a sound card device attached. again did I miss some answers, or part of the complaint??

I have not been able to figure this out from the service manual.

The 8 pin round mic jack on the front panel uses pin 1 for mic audio and pin 7 for the mic audio's shield. I'm trying to determine how long that internal shield wire is before it finally actually is connected to the chassis.

The block diagram suggests that the 8 pin jack is physically attached to the "digital" board.

Basically, I'm fighting RFI issues with this radio...RF getting into the microphone leads. I'm thinking I've got a massive "pin 1 problem" on my hands. That's where the so-called shield lead for a very low-level signal travels way too far inside the housing before it is connected to the chassis.

Before I go brute force and solder a wire from pin7 to the chassis behind the front panel, I want to figure out how the factory intended it to be done.

Can someone suggest what kind of analogic meter should be used
together with the TS-850? (Via the rear DIN socket I mean).
I did experiment with several sensitivities, but I got alterations in
the reading of the onboard bar meter, which I don't find correct.
Thanks !
Enrico

Leaky diodes cause low voltages on the IC and they go out a lot more often than the IC's.

9726. Re: Low transmit power on 20,15,17,12, and 10 meters on 850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-18 14:38:40 UTC
From: avvidclif
Topic: 9649 Message: 9726

When having problems with tx power or low receive check the RX BPF diodes. On IC1 with the radio on 20m Pin 4 should be low. Pins 1-3, 5-7, and 9-11 should be over 11v. If not the following give the relationships:
Pin # Diodes
1 9-21
2 5-17
3 4-16
4 12-24
5 6-18
6 15-27
7 14-26
9 10-22
10 7-19
11 13-25

Q6 controls D8 D20
Q7 controls D11 D23

The first diode listed is on the input (antenna) side and the most likely to fail. The most common failure is D4 or D5 which go to Pin 3 and Pin 2. If either of these pins is low remove that diode and check the voltage again, if still low remove the other diode of the pair IE; D4 D16 or D5 D17. If still low then the IC is suspect.

9732. Re: [TS-850_450_690] ts 850 different output power on all bands

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-20 22:34:55 UTC
From: Tom Jones N8NMA
Topic: 9729 Message: 9732

I copied and posted this from Clif may give it a try...

Tom N8NMA

When having problems with tx power or low receive check the RX BPF diodes. On IC1 with the radio on 20m Pin 4 should be low. Pins 1-3, 5-7, and 9-11 should be over 11v. If not the following give the relationships:
Pin # Diodes
1 9-21
2 5-17
3 4-16
4 12-24
5 6-18
6 15-27
7 14-26
9 10-22
10 7-19
11 13-25

Q6 controls D8 D20
Q7 controls D11 D23

The first diode listed is on the input (antenna) side and the most likely to fail. The most common failure is D4 or D5 which go to Pin 3 and Pin 2. If either of these pins is low remove that diode and check the voltage again, if still low remove the other diode of the pair IE; D4 D16 or D5 D17. If still low then the IC is suspect.

Clif

9738. Rough CW

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-24 17:02:59 UTC
From: villy.madsen
Topic: 9738 Message: 9738

A 6xx series TS-850sat with very few hours on it - I bought and hardly used it (a couple of hundred hours maybe) until I decided to get back on the air last spring.

The note is a T6 to T7 - noticeably rougher than the side tone - on cw, wwv any other carrier that I can find.

I have checked the CAR board - no visible signs of any problems (the black goop that they used to glue down some of the components on bottom of the board worried me for a moment...

Is it worth replacing the CAPs on spec ?? or is there another path to take first ??

Thanks

Villy ve6sq

It's also here:

http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=14554

See the All-band transmit section a little down the page. This was a fairly
easy mod (for me anyway) and allows me to transmit on the 60-meter band.

9740. Re: Rough CW note

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-24 22:30:35 UTC
From: villy.madsen
Topic: 9738 Message: 9740

I have taken the liberty of uploading VE6SQ.MP3 containing a short recoding of two different 20M CW stations & a bit of WWV (with and without the audio tones).

The audio was taken from Pin3 of the ACC2 jack. I can't hear any difference between what was recorded and what I hear in my Heil Proset headphones.

Another tidbit - I live within a couple of miles of one broadcast antenna farm & within 4 or 5 miles of another. Until they switch their pattern/pwr out in the evening, I get a significant number of birdies esp on the 80 m band.

Thanks

Villy VE6SQ

Shortly after my previous post, I started getting unlocks - a unl in cw & dots on the display.

I guess that the next order of business would be to replace the SMD electrolytics on the CAR board... and check TC1

Hi agail, all.
Thanks for your reply re- extension of the 40m band.
Ineed to know how to determine if my TS850 is a European or US version ?
How can I get detailed info from my serial number, like date of manufacturing etc. Thanks

Try transmitting into a dummy load on parts of the bands in which are allowed in the US opposed to EU?

I don't know if he has an EU model or not, but in the off chance he wants to work 60 meters too, he'll have to do that mod to do so.

I also use mine with an oddball UHF transverter that uses a 22 MHz IF.

I have a similar situation I think.
I have a Microsoft Headset w/Mic that works well for Windoze, but I would like to Clip the cable and use it on a TS-450 radio. Are there any special considerations I need to make in order for that to happen?

I have an excellent Microsoft Headset w/Mic that I think would be good for contest use. It has a USB cable on it which I am thinking of cutting off to access the wires and run them to to a "splitter plug" designed for Kenwood radios to plug into the mic/headphone jacks on the front of the radio.

Do I need to add any components on the mic end to match it to the radio and/or bypass any potential RFI? I recall trying something similar with a TS-50 and found there was not much audio-volume into the radio.

Curiously,
Ron

If I understand, usb headset are (digital??) not 600 ohm or 1000 ohm inputs... they convert the digital signal to the sound card. I am not sure it would work. BUT if you are successful, let me know, I would like to try different mikes as well

another way is to just talk to your computer, with the speaker monitor ON, feeding via sound card interface, into the radio mike jack, with VOX on ...

I am having lock problems....

I tweak TC1 and it works for a while - and then I have to re-tweak.

I haven't been able to find a schematic for the pll osc.
can someone tell me what the value of the trimmer is & a source of piston trim caps ??

Also is the proper trim tool for TC1 a standard hex toll as we used to use for IF transformers ??

I am having a problem trying to get something that works reliably ..

Thanks

Ron, only thing I might add to that cutting the connector off and putting on a new connector...sometimes those little wires are more like a thread then they are a wire. VERY difficult to solder back. You might try to see what the wires are before you cut them off. Dave

From: John Geiger
Topic: 5218 Message: 9760

I have for sale the following Kenwood CW filters:
1. YK-88C-1 500hz CW filter for the 8.83mhz IF. It works in the Kenwood TS450/570/690/850/930/940/950 series of radios. Asking $75 shipped.
2. YG-455C-1 500 CW filter for the 455khz IF. It works in the Kenwood 140/450/680/690/850/930/940/950 series of radios. Won't work in the 570. Asking $85 shipped.
Take both filters for $150 shipped. I can take paypal/check/MO.

From: John Geiger
Topic: 9761 Message: 9761

I have a couple of DIN plug sets that came with a Kenwood TS950 I recently purchased. Both are unopened in the plastic bag. These are the common DIN plugs that will work with most radios.

Bag one has a 7 pin DIN, 8 pin DIN, 13 pin DIN, and 2 automotive type fuses. Asking $15 shipped for this bag.
Bag two has a 7 pin DIN and a 13 pin DIN. Asking $10 shipped.
I know the 13 pin will also work on some Icom transceivers like the 718 and 706 series. The 7 and 8 pin DINs are also used on the Icom 746 along with many other models.
I can take paypal/check/MO.

Hi Dave

Ain't that the truth! I bought some cheap mic's at the Goodwill store here, just to cut the cords off for other uses.

When I cut the cord off, you could't even see which wire was which. It just looked like a bunch of stranded wires. I guess the coating on the outside of each wire is the insulation. 73
Tom W7WHY

Ron, only thing I might add to that cutting the connector off and putting on a new connector...sometimes those little wires are more like a thread then they are a wire. VERY difficult to solder back. You might try to see what the wires are before you cut them off.

Ok , The radio has behaved for the past few weeks until last night. It started to go nuts again. I kept it on until I was able to trip off the covers and front panel. When I unplugged the connector for the Optical Encoder , It stopped. I pulled the encoder apart, cleaned it up as best as I could , the out of control tuning has stopped, but the dial is flaky .

When I dial around , the frequency will jitter , then jump backwards a few kc then jump ahead.

I suspect it is the optical encoder .

Anyone know who would still sell these ? Searching for the COPAL part number stamped on it gives me no results.

Digikey , Mouser, Ebay are all a bust.

(possible 850 bone yard ?????)

The closest item I was able to come up with , was a combo unit (encoder with some sort of pot and bracket) for some other application. The numbers are the same with the exception of the last letter in the part number.

If I had to , I would buy this other unit if in stock , splice the harness but worried the shaft wouldnt be the correct length.

Any suggestions ?

This is what I was able to come up with

http://www.pacparts.com/part.cfm?CFID=3691534&CFTOKEN=22543883

http://www.partstore.com/Part/Kenwood/Kenwood/W02183615/New.aspx

Both state to use a " new part number" but both are different numbers and also different prices..... Both say that same encoder is used in the 450 , 690 and 850 ...

The question comes as to what one is the REAL correct one. If either ?

Without sending it out , and risking the minute that I do , it behaves fine on their bench..... Yhere really is not much more I can personally do.

Unplugging the encoder while it happened was the advise of Cliff.

The coin toss has basically landed on this option IMHO.

(unless I can drum up a know working used one)

Now with the kenwood parts, they do have a 30 day return I believe I seen on their page. I guess if it really doesn't work , I could send it back (providing it comes harnessed with correct connector).

Id hate to just give up on the rig , being I just bought it a few months ago. But with the decent price I paid for it , I think a few bucks to put into it , is still worth it at this point.

9770. Capacitors TS-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-28 14:55:52 UTC
From: cintrans
Topic: 9770 Message: 9770

Maby a dumb question...
When i touch capasitors C116, C118 or C117 on the IF board, the S-meter shoots way up and the agc voltage goes down, is that normal or does it mean the caps are running on their last leg???

9771. TS950 SSB offset problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-28 18:20:13 UTC
From: John Geiger
Topic: 9771 Message: 9771

I just picked up a used Kenwood TS950S (what a great sounding rig), that has an issue on SSB. I am asking on this reflector because I think its circuitry is similar to the TS850, and I know this is a great list to get answers on!

It appears that the transmit and receive frequency are off by 260 to 270hz. I have been living with it by just turning on the RIT when on SSB, which I don't use that much anyways on HF. When using USB you set the RIT to -0.26 and on LSB set the RIT to +0.26 and it seems to equalize the transmit/receive frequencies. This is something that I would like to fix, though. Any else have this problem before? Where should I start troubleshooting to fix it?

9772. Update on SSB offset problem in TS950

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-10-29 00:48:05 UTC
From: John Geiger
Topic: 9772 Message: 9772

I sent an email earlier today about an offset problem I was having on SSB with a used Kenwood TS950. Good news-I fixed the problem without taking off the covers. While looking in the manual for something else, I stumbled across the power on functions on p. 24 of the manual. It says that if you hold down the USB button while turning on the radio, it "enables the FSK and SSB signal pitch to be changed by the CW pitch control. This will make the receive frequency differ from the transmit frequency, so correction using RIT is required."

Well that sounded exactly like my problem. So I turned off the rig, held down the USB button while turning on the rig, and give it a try. I turned off the RIT and answered a XE2 station calling CQ. A nice 15 minute ragchew followed, and the 950 works fine on SSB now.

Not sure why anyone would want a function like that, but guess it is a case of reading the manual before operating

From: Jordan
Topic: 9773 Message: 9773

Hi....has anyone had an issue with drift when using the 790A with the 1296 option...?

I'm thinking it might be the 3ppm 10.240Mhz base osc., which is later multiplied, but I could be wrong.

Would a 50-60C crystal heater help...?

Other than this, this is THE VHF/UHF multi-mode.!!!

Topic: 9773 Message: 9774

The question is; how much drift and over what period of time?

A 3 PPM xtal can move 360 hz at 1.2G and still be within spec. While I've never measured it I would not be surprised at 3-500 hz drift in the first 30 min and less than 50 after that, at 1.2G. Any drift should be a slow movement, not a rapid change.

Adding a heater may help but it's my understanding the xtal has to be designed for it.

Hi all

I know this is a repetitive question, but recently lost all data.
How can you tell the manufacturing date of my TS850, from the serial number ?
Also any other data that can be decoded form the serial number.

Thanks

Paul

9776. TS850SAT Serial number

First number of serial number minus 2. Example: 3 minus 2 = 1, or 1991. I think the next few numbers are month and day, and then production (serial) numbers. W8YS

Yes...I'm getting a positive drift of ~+ 550hz over the first 40 minutes, then a quick drop back to 0hz offset, then a slow downward drift over the next 1.5 hours to ~-200hz offset..

The first hour is pretty drifty....73...Jordan....

An unknown gem of the Mediterranean sea is the Island of Malta. blessed with
warm sun , all year round.
In just one day, you can see places which will make you travel in history
from the Prehistoric temples, coming of Christianity, throu the middle
ages, the Knights of Malta, all the way to world war two. All the major
civilizations have left an imprint on this lovely little island. There is so
much to see and enjoy the excellent weather.

I'm wondering if a DEMI type of crystal heater mounted to the case of the oscillator would help...It would bring the temperature up to 50 or 60C depending on the heater selected....It needs to be soldered to the case, and it appears that the case of of the LO is grounded so it should work electrically speaking.....

I noticed the same very rapid QSY back to near the original frequency on 1296 and 144 right around the 1 hour mark after turn-on...
On 1296 the shift is from ~ 500hz high to ~ -100hz, or about 600hz.

On 144, the shift is from ~ 60hz high to ~ 0hz, or about 60hz...Not sure how much of the 10:1 ratio is arithmetic and/or chance....

I have a DEMI transverter that I use on 1296. It is fairly stable after it warms up. The problem is accuracy. When you are working stations on 1296, you have to do a lot of tuning to find each other. It is the nature of the beast. Plan on sending a LOT of dashes. DEMI is recommending the use of an external 10 MHz source to improve stability and accuracy. They are getting there. I have always wondered what the accuracy was in the 1296 sections of the "all in one" radios, i.e., 790, IC-910, TS-2000? I bought the transverter for the 50 watts.

There you go! I think I will be sending lots of dashing and tuning manually. Getting one of those things only solves half the problem because you will be the only one out there with an accurate frequency!!!!!

Thanks Clif.

Then there's this gps-based 10 MHz reference unit:

http://www.jrmiller.demon.co.uk/projects/ministd/frqstd.htm

I want one for my test bench.

Or, you could go this route with your transverter, rig, or both:

DB6NT Crystal Heater,
http://www.kuhne-electronic.de/en/products/crystal-heater/qh-40-a.html

73.

Still going to send long strings of dashes and tune. 1296 QSOs are very
hard to come by around here. Usually during a contest or possibly
during a major tropo opening. The rest of that stuff is too rich for my
blood based on dollar vs. QSO. Kind of like dove hunting.

By my calculations that's about $441 USD and then you get to find an antenna and power supply. I like mine better. All in one deal.

Clif

9787. Is the Kenwood TS-440 ACC2 the same as the TX-850 ACC2?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-01 18:26:27 UTC
From: bud Thompson
Topic: 9787 Message: 9787

Sorry posted on TS 480 group!

I am trying to use a Kenwood TS-440 in place of a TS-850 on HF Pactor for some testing.

(I had a 440 years ago - and thought the 440 and 850 were the same animals with the ACC2 data port and that I should be able to use either radio with the same TNC and TNC to ACC2 cable. So far I've not been able to get either of two (2) 440 radios to key using that cable. RX audio is coming through okay - and I assume TX audio as well - but won't know until I can key the radio.

What am I missing?

Thanks,

bud N0IA

the ts4340 used pin on some interfaces, while the 850 uses pin 13.

if you bridge a diode from pin 9 to pin 13, it will work on either

Folks if you need Kenwood parts PLEASE go to www.kenwoodparts.com FIRST.
They are the Kenwood parts distributor on the east coast. If you don't like their price then start shopping around.

And they have your part.

search the manual for the kenwood part number and check with eastcoast transistor, but the number (of the part??) makes it look like a regulator (9v) the dl is the package type

did you check www.nteinc.com

Here is an update. I was able to get the part ordered from kenwoodparts.

Kenwood KEN-W02-1836-15 $64.95
Shipping/Handling: $14.95
Tax: $4.80

GRAND TOTAL: $84.70

WHAT A SCAM ..... They charged me 14.95 on shipping on a part that was a few ounces BECAUSE it is in the second tier price category. AND they charged me tax. Last time I checked, they are NOT in my home state of PA to charge me sales tax.

They quoted me a price on the phone that was 5 dollars less the posted price, THEN jacked the shipping up 5 bucks more because I did not web order.

grrrrrrrrrrr

9799. TA78DL09P

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-03 12:52:54 UTC
From: Patrick Egloff
Topic: 9799 Message: 9799

JR,

Maybe i'm wrong, (i did'nt look on the diagram) but your chip could be a 9v fixed low drop voltage regulator !
Search for ANY 500mA low drop 9V regulator, and that should be OK.

It's certainly a TA78DL09P (zero nine papa) and not a o9p (oscar nine papa)

I don't know the input voltage present on this regulator, but if you have more than 12V, you could also use a normal 78L09 regulator which costs a few cents (Euro or Dollar hi hi)

Hope this helps,
73, Patrick

Dear OM.
I would suggest trying to do a microprocessor re set.In your manual it will tell you how to do this step.Most modern transceivers...and some not so modern....exhibit this fault and it usually is 'fixed'by a microprocessor re set.It is usuall achieved by a combination of keys for example on the TS940SAT Kenwood...it is done by switching the power on at the same time pressing the a=b button.I hope this helps OM and I am sure other people will come up with suggestions ...good luck 73 Barrie g4yjs.

Hi Joel
Sometimes my '450 does that, but only when the power from the power supply drops too low. The |Sometimes the power on the supply drops to about 6 volts and the radio starts sending 'UL' and the display goes away. When it does it again, check to see what the power supply voltage is. 73

To do a reset on the '450, hold down the A=B key and turn the power on.
That will reset the radio.

You might have to go to the menu and do some changes after you do the reset.

Joel

Is the set from a smoking user, I had one and cleaned all the pcb's in the VCO area and it cured the same problem, check the VCO's are correctly set as per the service manual, they drift off with age and it sounds as if your control voltage is out of range to accept initial lock.

9808. TS-850s for parts or repair

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-04 18:54:49 UTC
From: wmpayer
Topic: 9808 Message: 9808

All,

I have a TS-850s radio with a dark display. The radio still works fine as I used it with Ham Radio Deluxe before boxing it up. I expect that it can be repaired, but I no longer need it.

If anyone is interested, please contact direct me with an offer.

Bill

Hi JR,

TA78DL09P is a positive 9V linear regulator. I found it in a Toshiba catalog here:

http://www.semicon.toshiba.co.jp/docs/catalog/ja/BDJ0036_catalog.pdf

Of course, all the text is in Japanese. At the top of the page where this part appears is the (translated) text that says:

"The following products are products that will be obsolete and discontinued. If you are a new design alternative varieties
Please consider the hotel."

On the Toshiba website, I of course found no such current part number. However, I did get four hits when searching for TA78DL09 without the P suffix (PN TA78DL09AF, TA78DL09AS, TA78DL09F, and TA78DL09S). They're all listed as 9V/250mA three-terminal low-dropout (0.6V) positive voltage regulators.

The TS850 PLL PCB looks like it takes a TO-220 or TO-202 package. Take a look at these... they're all rated at 0.5V or less dropout, and 500mA or more output current. They have the same pinout as the Toshiba part:

Mfr: Rohm
PN: BA90BC0T
Current: 1A

Mfr: ST Microelectronics
PN: LF90CV
Current: 500mA

Mfr: National Semiconductor
PN: LM2940T-9.0/NOPB or LM2940CT-9.0/NOPB
Current: 1A

Digi-Key shows them in stock.

Hello,

I wonder if some of you got a Power Cord Connector, the one on the back of the rig. Mine is broken and I want to fix that. If anyone of you can help me with this part it would be nice.

9811. TS-450S for WSPR and JT65

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-05 08:35:17 UTC
From: mob3mc
Topic: 9811 Message: 9811

I found more success on the SPR mode with the TS-450S than with the TS-570 d. I am using an inverted V for an antenna and I just switch units. I know a better antenna will help and that is being worked out in the very near future. Still no joy with JT65 and will be looking for reactions on your experiences on these two modes. I use the Rigblaster Plug & Play interface.

73,

Jojo

Joel,
In the files section,

http://groups.yahoo.com/group/TS-850_450_690/files/ALIGNMENT%20FAQs/

click on ts450_690 PLL and car alignment.pdf...

By the way, I will be setting my VCO on the
"new" to me TS450 I got yesterday,
it has a "raspy,scratchy" receive audio and low
receive sensitivity, I'm hoping it just needs alignment
and is not a failing Car DDS chip....
Hope this helps...
let us know if you "cure" the Dots...

thanks Nail

I believe that I found the problem, in the IF unit is 3 damaged diodes, continuity for both sides, the previous owner introduced voltage for the connector vertex.
the rele of antenna entrance is not energized, the point RL doesn't have voltage

which is the substitution?

9824. KENWOOD TS 850 PARTS NEEDED

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-08 23:34:51 UTC
From: eagle one
Topic: 9824 Message: 9824

Greetings. I have a Kenwood TS 850SAT which does not TX and need the :-

IC4 - Kenwood part number : YM6631. Description : IC (DDS). Location CAR unit (X50-3140-00).

Alternatively , the module that has the IC 4 is the CAR unit (part number : X50-3140-00)

If the IC is not available, then I have to replace the CAR unit.

The problem is that the the IC4 of the CAR unit does not generate the Car (carrier) signal during transmit mode. During receive mode the signal is present.

Any body has and would like to sell it, please contact me directly. Thank you and best regards.

Hanafi

9825. Moved battery in 850 and now battery is going dead

Yahoo group: TS-850_450_690 (2010 — 2016)

I recently moved the battery in my 850 and now the battery is going dead. Tried two batteries and it did the same thing. Holder seems to be fine. Just wondering if this problem has ever happened to anyone else.

Tom

are you soldering the battery to the new location, or using a socket.

what battery are you using.. (number on the battery)

did you double(triple)check the location of your leads to the board on the
850 to be sure you are on the correct solder pad??

Do you have 2 positive wires from the battery? If I remember there are 2 positive and one negitive I did mine 3 years ago and it has been fine since.

I've had this happen before... turn off Noise Blanker #2 (NB2). That'll cure the blanking you're hearing.

Hallo,
I had the same problem.

Your problem is still the begin and will be more worse and the display shows only dots.

Indeed a PLL problem.

See link below I changed the capacitor and the problem was solved.

Here is the diagnose and teh repair instructions.
I followed and with succes.
http://n6tr.jzap.com/850repair.html
Look for "Raspy signals on some, or all bands. Frequency display all dots or blank."

9835. Distorsion on receive and transmit for a TS850s

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-13 17:36:52 UTC
From: Delta
Topic: 9835 Message: 9835

Hello everyone,

A friend of mine has a nice TS850s. In the last few days some problems occurred. To be more exactly he notice some heavy distortions on receive and almost the same phenomenon is present also on transmit.
I have listen his signal on the band and I can say that the tx distortion appear mostly when he make a break, like between words. It sounds like a kind of compression, when he's not speaking the noise appear. It sound like the distortion made by a class A CB amplifier...
I guess is from the FI area someplace. Possible one of the electrolytic capacitor got some problems...
The old fashion Kenwood TS850s electrolytic problem, heh.

What do you think? I guess is weird that the problem is also on rx as it is on tx. Did you encounter such a weirdness ?

All the best, 73

No but it seems a bit dim. I have checked the supply and the voltage on the ends is around 350 volts p/p. I know the 850 has always been a bit dim for my tastes. The cap etc. are fine. I would like to retrofit a slightly brighter lamp. We have them at work for our Fanuc controls but they are a bit big. HIHI I'll have to pull it apart and measure the diameter and the length. I was hoping someone had done that so I wouldn't have to. I was also wondering if there was room for led's behind the lcd. I guess it's time to dig into it. If I had an old display I could play around with it before I do mine.

Most of the ones I've seen that were dim came from a smoking environment. Residue on the display and the tube.... The voltage is OK.

9841. VOX sensitivity problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-15 17:49:51 UTC
From: w0iea
Topic: 9841 Message: 9841

I recently purchased a TS-450 and everything works great except for the VOX circuit. At max gain, the vox won't key up at normal voice levels. It will key with loud voice. The audio level for normal communications is set to about the 9 oclock position. On air audio reports are very good. I have not opened the radio yet. I am guessing the problem is in the Q73 area.
Any advise would be appreciated.
Thanks in advance.
Jack

Hi Jack

Kinda sounds like maybe the anti-vox is set too high. Did you try it with the headphones plugged in, or just with the speaker. If the anti-vox is set too high, ti won't key. 73

Date: 2010-11-15 21:24:50 UTC
From: w0iea
Topic: 9841 Message: 9846

I have run the anti-vox through it's range with no effect. If I turn down the vox gain, it won't key on loud voice so it all seems to be working except not enough gain.
Thanks for your reply.

Hi Tom
Cliff asked the same question. It's not caused by the anti-vox. I am using a Heil Pro head set.
Thanks
Jack

To Glenn K4ZOT -

Welcome to the group... my first HF rig was (I still have it) also a Kenwood TS-830S.

I have a very nice Kenwood TS-690S that I might consider parting with. It is identical to a TS-450, but with the addition of 6 meters. Runs great, looks great, original factory box set, power cable, mic, etc. If you'd like more info or to talk, my email is good on QRZ.

73,
Howard

HI:

I am a new member on the Group. I currently own two TS-830S and I am interested in upgrading to a TS-450S mainly in order to use computer control with HRD. I am retired and as always price is a concern. I would like to purchase the rig and PS. Any assistance would be appreciated.

Thanks,

Glenn

I use a Kenwood TS-850 but that would be overkill for listening to numbers stations alone. It's also a great contesting radio.

You should have no trouble hearing most of the M08 and V02 transmissions from Cuba. Also many of the E10 transmissions by Mossad.

9850. ts-850 repair

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-16 02:06:09 UTC
From: alk0frp@comcast.net
Topic: 9850 Message: 9850

I have a TS-850 with a blown pin diode due to a proximity hit about 3 years ago.
I have been in financial problems and just getting out of the hole. I can not find the pin diode to repair plus I need other repairs done. Who out here does this repair. I no longer can get Bill Leahy K0ZL in the Denver area as he is a SK.
Bill had a Full Monte for the 850 but not all modes need to be installed.
I repair radios but this is a bit above me. As my expertise is not that well tuned.

Please advise Al K0FRP

I just had Mike Nadeau, N1EQ work on my 850. Also had him do work on a 450. He is thorough, fast (will have it back to you within a week), and very reasonable. Check out his reviews on eham.. a perfect 5.0. He is very knowledgeable on Kenwoods. Take care, Scott

9853. Advice - Would you buy an 850 today?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-16 22:03:26 UTC
From: w7smj
Topic: 9853 Message: 9853

Hi Group,

I'm interested in getting into some SDR aspects and the TS-850S makes that an easy proposition through the IF out jack. The great receiver qualities of the 850 would be icing on the cake.

I'm concerned about the age of most rigs and the fact that it seems the DDS chips being a common point of failure are no longer available.

My question is: Would you risk purchasing a higher serial number TS-850S today. Do you have any opinions on the long term reliability of the current TS-850S population?

Thanks & 73,
Scott

If I could I would buy another high serial in a heart beat if the price is right. I would take a new 590 if anyone wants to give me one:) also. I have a 5Mil 850 and would not let it go.

the 850 is ok, why don't you just buy a new flex? - the if hookup can be a hassle, plus you won't be able to use all the features of the power sdr software. buy a 3000 or flex 5000, or even a used sdr-1000 and have the best of all worlds.

Just bought an 850 about 2 weeks ago. I'm using N8LP's pana and PwrSdirIf. Works great. I was using a K3 (actually had 2) and loved the rig BUT I couldn't see the investment in the K3. I settled for a 80 mil s/n 850. About $900 invested in the rig and the pana. I'll keep it and wait and see what happens in the sdr world. I do work on my own stuff, and have had many rigs including 850's. I was using a 440 which I tapped the if and used the pana. A friend has it now. When I see Phil's sdr is finished I'll look at that. I know of many 850's still playing fine.

I have definitely considered a Flex, but I can't justify the price tag of a 3000 let alone a 5000 when I already have three good transceivers. I have a mint 450 that I'm considering selling to partially fund the purchase of an 850 but I hate to let the 450 go...

I'm thinking about the exact setup or perhaps an SDR-IQ instead of the LP-PAN.

Perhaps I should just tap the 450 IF to get started...

5 mil is as low as I would go that's when I believe they started putting in the newer DDS chips.

remember an sdr-iq is going to set you back 500 bucks, plus everything else to connect it and get it working - you might pay a bit more for a flex 3000, but much less hassle, less wires and less space. in the end you'll be happier.

The serial number of my 850 is in the middle 50 million range. I've had to replace the battery and adjust a couple of voltage settings. I've also had some mods performed (CW sidetone now available on the MONI control, etc.). As one other respondent said, I'm also hoping to get a new 590, but my 850 is staying right here. If you can find one in good condition in the upper serial number ranges, I would say it's worth the "risk".

I bought my 30 mil s/n TS-850 new in January, 1993. It's been a great radio and I have absolutely no regrets over buying it
and would do so again without hesitation.

I've replaced/relocated the battery and replaced all caps on the carrier board and on the display board as well as all caps associated
with the audio output stage. The only mods I've done have been the cw sidetone monitoring mod and the noise blanker mod.

If a late s/n 850 comes along at the right price (and the XYL isn't looking), I'll probably pick it up to keep this one company.

73,
Alan, KD5R

P.S. Bill Gates obviously isn't a ham...the spell checker wanted to replace "cw" with "cow".

and would do so again without hesitation.

I've replaced/relocated the battery and replaced all caps on the carrier board and on the display board as well as all caps associated

with the audio output stage. The only mods I've done have been the cw sidetone monitoring mod and the noise blanker mod.

If a late s/n 850 comes along at the right price (and the XYL isn't looking), I'll probably pick it up to keep this one company.

73,

Alan, KD5R

P.S. Bill Gates obviously isn't a ham...the spell checker wanted to replace "cw" with "cow".

Subject: [TS-850_450_690] Advice - Would you buy an 850 today?

Hi Group,

I'm interested in getting into some SDR aspects and the TS-850S makes that an easy proposition through the IF out jack. The great receiver qualities of the 850 would be icing on the cake.

I'm concerned about the age of most rigs and the fact that it seems the DDS chips being a common point of failure are no longer available.

My question is: Would you risk purchasing a higher serial number TS-850S today. Do you have any opinions on the long term reliability of the current TS-850S population?

Thanks & 73,

Scott

9866. Implementing MONI style functionality in the TS-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-17 02:37:44 UTC
From: Ron
Topic: 9866 Message: 9866

I recently picked up a TS-450 and overall I am very pleased with it, however, I am dismayed to discover that there is no MONI function for transmit audio. Has anyone ever thought to implement a mod for the 450 to produce some sort of equivalent of the MONI on the TS-850 and other radios?

Curiously,
Ron

I bought another TS850 about a year ago. It came with new chips that weren't installed. My original 850 that I bought new with the old chips still runs great. The original one has been to Kenwood at least twice and Avvid once I think. They do break and I'm not a tech. As long as Clif at Avvid is around, I will keep mine. I had an encoder go on mine and the part was discontinued but I found one on the web. Also found a tuner for the new one which didn't have one. Put that in myself after getting a longer cable from Avvid.

I guess it just depends on how much you enjoy them.

I have used the Inrad 2.1 with the Kenwood 1.8 in my TS-450 8.83MHz
stage, and preferred the Inrad. Although the 'nose' of the Kenwood's
response might be narrower, the adjacent-frequency rejection seemed
about the same, bottom line the Inrad seems to pass more useable
audio.

Right now I'm using the Inrad 2.8 with a CW filter in the other 8.83
position; for a SSB contest I'd be inclined to run the two Inrads 2.8
and 2.1.

I find 1,8 too narrow for ssb.
Does not help that much and audio becomes tiring.
It's very subjective, anyway.

Hi,
I have used 1800 hz filter on TS-450SAT and 2100HZ filter on TS-690. I much prefer the 2100Hz filter. If you're public service oriented and spend some time on nets you'll find that we have more yl and xyl participation and the extra 300Hz is especially important to making the female voice more understandable.

Hi, Does anyone encountered or repaired this problem? my brother 850 is having this problem, There is a mix RX on ham band of AM broadcast, before he does not have this problem. I suspect it happen or the radio were damage during his antenna calibration or swr checking / tuning, sort of RF return to the radio due to high SWR? After that he said he is hearing AM broadcast. He is near an AM broadcast staion i suppose but before there were none of this, Hope anyone can give help how to trouble shoot or what is the possible problem and solution.

Hope Cliff can give me advise also,or anyone with this probelem before.

Thank you,
Alex

I have the 2.1Hz Inrads in both IF's of my 850 tried the 1.8 Kenwood and Inrad the audio passband is to narrow and if you do any contesting like I do it is very tiring on the ears. The 2.1hz is so much better and I would recommend them over the 1.8Hz and over any Kenwood filter.

9881. Another serial number post

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-20 07:20:14 UTC
From: w7smj
Topic: 9881 Message: 9881

Hi Group,

I decided to take a chance and purchased an 850. The rig was reported as working great and I'm anxiously awaiting it's arrival.

I am a little perplexed by the serial number though. The rig I purchased has a 70300158 serial number. The previous owner stated that he purchased the rig new in January 1990.

I know the conventional wisdom says that with that serial number the rig was produced in March of 1995, but I doubt the previous owner is off in his recollection by five years. (I hope he is though!)

I have seen other posts that indicate the serial number is based on the reign of the Japanese emperor or that you cannot base manufacture date by the serial number and that Kenwood only knows for sure.

I thought one way to either prove or disprove the subtract two years from the first digit hypothesis is to publish some data so I'm requesting that anyone who knows for a fact when their rig was purchased new reply with the purchase date and serial number.

I purchased my 450 in October 1995 and it has a 60300108 serial number which would seem to fit the subtract two rule.

Thanks for your help and 73,
Scott

9883. For Sale: Kenwood DRU-2 Digital Voice Recorder

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-20 19:11:40 UTC
From: TennAce
Topic: 9883 Message: 9883

Don't you wish those PLAY and RECORD buttons worked on your Kenwood TS-850 or TS-950SDX transceiver? They would if you had bought the DRU-2 option board. The original Kenwood part is nearly impossible to get, but my PIEXX-manufactured replacement DRU-2px board is now for sale. The three messages are each 32 seconds long! Physical dimensions and connector types are the same as the original DRU-2 board, so installation is a snap. Installation Instructions included as PDF file.

139.00 USD includes Shipping via USPS to CONUS (PayPal accepted) (weight 0.4 lbs) Email to: wo4o <at> att <dot> net

9884. For Sale: Kenwood IF-232C Interface

Topic: 9884 Message: 9884

Facilitates the connection of a personal computer to transceivers capable of computer control. This device acts as interface between the radio and the DB25 RS-232C serial port of a computer. It is essentially a voltage converter between RS232 level (-12 to +12V) signals of the computer and the TTL levels (0 to +5V) of the radio. DC power cord, 6-pin DIN cable (connecting IF-232C to transceiver) and Manual (in PDF file) are included. Requires 13.8 VDC 150ma power supply. 5.375 x 1.7 x 4.5 inches. 1.1 Lb. Can share the same Power Supply used for the transceiver. Yes, it works!

59.00 USD includes shipping via USPS to CONUS (PayPal accepted) Email to: wo4o <at> att <dot> net

9885. TS-850 Tuner Question on a unit for Sale

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-21 04:09:35 UTC
From: k4zot
Topic: 9885 Message: 9885

Complicated situation - I am looking at buying a TS-850 in the 50M serial range. The owner does not know if it has a tuner which obviously has alot to do with the price. The serial number seems great, but how can I determine if it has a tuner if the owner doesn't really know, but thinks so? I'm having a better picture of the front and rear set to me.

The front is labeled TS-850S, but I do not believe the tuner version has TS-850SAT on the front panel? I do see three rectangular buttons on the left side above the "Phones". Is this conclusively for the AT?

Are the 50M units free of any DDS, Cap or memory battery issues?

Thanks for any information.

Mine also says "TS-850S" on the front. I believe they all say that.

There would only be two ways of telling if it had a tuner:

1) Open it up and see if it has one in it. You cannot tell by looking
at the outside.

2) Connect it to an antenna or dummy load, push the "THRU/AUTO" button
and then push the "AT TUNE'" button. You should hear the gears of the
tuner working and the SWR meter reading bounce up and down as it tunes
if it has the internal tuner.

I am not sure how anyone can NOT know if they had a tuner, unless they are
buying selling and not the original owner of the radio

btw: my ts850s has a tuner but states on the front ts850s, not sat...

can they hook up the radio to an antenna or dummy load.

they could hit the button to see if it makes noise..

Sometimes people plead ignorance to hide that it does not have one. I would buy it as if it does not have one if he can't prove that it does.

That is great advice Randy......none of the units were marked /AT on the face. I would:

1. Want to test it if it had one.

2. I would still look inside the radio anyway. You can't miss it. :))))))

I am suprised that Kenwood did not mark it on the radios Like they did with the 440/940 ect. I have a 850 in the 5 mil range and it is not marked but it does have the tuner.

Even if it came with a tuner, people will take them out for various reasons. I know of one ebay seller that does that routinely. He will buy a radio and strip filters, voice recorders, and tuners etc..Sell the radio and accessories separately. Unless it is verified by opening the radio or hooking it up and operating the tuner you will not know until you receive it.

Good luck!

One such Ebayer in Ky just sold an 850 parted out. I added up the price it all sold for and they got (it's a business) more than the radio would have bought sold whole. The pics were funny. The carrier board still had the surface mount caps and you could see where they had leaked on the board. I think it sold for $139 or so. It had the old dds chips. Maybe I should part mine out. I bought mine to use PowerSdrIf with. I've had several in my life and worked on numerous units. Nice rig for phone.

Hi,
I just pulled my TS-850 out of it's box after several years. I stopped using it a few years ago when the front panel started intermittently going blank.
I hooked it up and ran it with computer control from Ham Radio Deluxe and that all seems to be ok and after a while the front panel came back to life (for a while). It still operates ok from Ham Radio Deluxe even when the panel fades blank. All of that to say this...

I hooked up a dummy load and wanted to see if it still works well on all bands. I turned the tuner on(Auto/Bypass switch depressed) and tuned to the dummy load...95 watts out as indicated on my Daiwa power meter (remember the front panel display is now inoperative). Switched bands and hit the key...hmmm only twenty watts out. I found that when I switched bands the tuner does not reload the rig well without a specific tuner call from the front panel even though I hear the antenna tuner do a coarse seek. If the Auto/Bypass switch is depressed to enable the tuner and I hit AT Tune button the "On Air" and "AT Tune" lights will come on. If you do not have an antenna or dummy load hooked up be sure you turn the PWR knob and CARR knob fully counter clockwise. With both them CC wise it will limit power output to milli-watts and will not endanger or harm anything. The PWR and CARR button are directly below the Kenwood name. I believe that if there is no tuner installed the AT Tune light will never come on.

My rig also says Kenwood TS-850s on the front panel but has a tuner installed. I don't know if any of them had TS-850S/AT silk-screened on the front panel.

I guess TS-850 needs a trip to Kenwood or Aavid repair shop.

73,
Mel - KF6OZ

9897. RE: [TS-850_450_690] TS-850 Tuner Question on a unit for Sale

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-21 22:22:52 UTC
From: Mike
Topic: 9885 Message: 9897

If I remember correctly, the tuner will not operate properly without
sufficient drive, I believe it needs about 10 watts out to tune properly.
You shouldn't ever transmit without an antenna or dummy load attached
regardless of how low the Car and Power knobs are set.

Just my opinions.

Send it to Avvid......you will get a much better job, faster at a VERY
reasonable price.......Personal experience with 850s, 450s, etc.

No they didn't mark them at all.
When I bought mine back in the day, it had no tuner, and I bought a NEW one from Kenwood and installed it myself.
Works perfectly.

Just my 2 cents worth.

I am suprised that Kenwood did not mark it on the radios Like they did with the 440/940 ect. I have a 850 in the 5 mil range and it is not marked but it does have the tuner.

On the right side of the radio at the rear are cooling vents. Look in, if it's empty, no tuner. The tuner will fill up to within 1/4" of the vents on the cover.

My thoughts; If he doesn't know whether or not it has a tuner he's probably not a ham and anything he said about the operation of the radio would be suspect. Be careful.

Thank you Clif for the info,its a big clue whats going on the radio. Heres another question for this issue, the 850 was tested to another loaction and the broadcast station were not heard there but when it was returned or used to the original location it can pick up the broadcast. What iam trying to point is if the diode is shorted on the RF board will it still rx good or ok when far from the broadcast station? For sure the original location is near the a broadcast station. So it is over loading the frontend when near? The broadacst audio were mix on rx audio on all the band. Any advise for this situation?

Also another 850 were tested near the broadcast station and its not getting any broadcast station. Thats why we can say there is a problem with the other 850.

Thank you for your good advise it helps me alot. Hoping for another good advice from you.

Alex

Does anyone know where to find this part: X41-3130 D6 - kenwood TS-850S slope/channel print?
New or used.
tnx 73 de OZ1JJK.

9910. TimeWave DSP -9+ For sale

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-24 15:38:54 UTC
From: harveywizbang@aol.com
Topic: 9910 Message: 9910

From the mfg literature "The DSP-9+ uses digital signal processing technology to provide optimum filters for random noise reduction, heterodyne elimination and bandpass filtering. Digital Signal Processing (DSP) technology provides superior performance in reducing QRM and QRN."

If you don't have a DSP radio or want to avoid the high cost of added filters this is a great solution. (check e-ham reviews)

Use with your 830, 850, etc. to improve RX. $125 shipped to lower 48

Topic: 9910 Message: 9911

I will second the recommendation for the Timewave DSP. I've used the DSP-9+ to great benefit especially in digital modes(RTTY, PSK 31 and MFSK). I have made many digital mode QSOs that would not have been possible without the DSP-9+. If your primary mode of operation is voice, the Heil Clearspeech DSP speaker is also great. In my opinion the Clearspeech is sometimes better than the DSP-9+ for noise reduction depending on band conditions for the voice mode.

Christmas season is upon us and I always dread the increased noise problems on the bands from all the electrically noisy Christmas lights and displays. The Timewave DSP-9+ is a great supplement to many rigs.

Hello!

I am fixing a TS-850 for a friend which has a damaged (beyond repair) SLOPE control. Damaged section is rear one. I could use an otherwise broken control if that part is OK. I could take also the complete PCB.

Thanks and best regards,

JOSE

From: p59zm
Topic: 6075 Message: 9914

Interesting photo of that blown surge absorber.

I got in some parts for my TS-850. Bought it new. 3,xxx,xxx range serial number. Replaced the battery today. It had never leaked. Checked a lot of the common caps that fail. Do not see any indication of any leaking, but I will be replacing many of them.

I took a look at my surge absorber. It has the appearance of a blown fuse. Grayish in color. Is this something I can get from Mouser? Anyone know the part number or best source?

Date: 2010-11-27 04:14:06 UTC
From: Alex
Topic: 9915 Message: 9915

Hi to all
I want to ask any suggestion or comment regarding electrolytic capacitor overhauling / change on TS 850 / 450 / 690. My brother have this radios for over 10yrs, we did experience the common leaking problem of capacitor on 450 and 690 that cause damage to the radio but luckly we have it repaired.

At this time i was thinking to overhaul / change all the electrolytic capacitors since its not that expensive, only time and technical know how is needed, i do have metcal desoldering tool that is why i think it would not be to hard to remove.

So my question is, is it worth to replace all? Since this radios will be for keeps in the ham shack. Do someone have a good comment or advise?

Thank you,
Alex

Hello Bill,

This quote is from the link I've pasted below - "It appears that the early chips with the part number
6631 on them have the problem and the newer chips, with 66312 on them are fixed.
I would suggest if you have an 850 with the 6631 chips in them, that you
consider swapping them all out with new ones at the first sign of trouble.
I am not aware of any failures with the 66312 parts yet."

http://www.cqham.ru/ts850repair.htm

The chips are located on the carrier board. You'll have to remove the top cover of the radio and then look at photos on this link -

http://zievid.com/W6OT/TS-850/CarrierBoardCaps.htm

I have no idea what serial numbers on these rigs represent a changeover of dds chips, but my TS850 has a 30 million serial number and has the newer 5 digit chips with no problems so far.

I purchased my rig used and just to be sure of everything I sent it to Kenwood East Service in Virginia Beach, VA and had it completely gone through, aligned, etc. as soon as I got it. Very pleased with their service.

Hope this helps....

Howard

9919. questions re TS-450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-11-28 21:20:03 UTC
From: ve1ii
Topic: 9919 Message: 9919

I am attempting to get a TS-450S operating. Problem is it was damaged during a lightning strike.

At this point the receive section seems to be working fine but there is no transmit output power.

I just finished removing the output transistors from the amplifier board. Both appear to be bad. I will continue working toward solving that problem.

One question is:
1. How warm (hot) does the back, left side of the transceiver get after being on approximately 3 hours (receiving only)?

Also, I would appreciate hearing comments on how the cooling fans operate. The ones on this transceiver have not turned over yet despite the fact that the back of the radio is fairly warm.
Mind you I am not attempting to transmit at all due to the removed finals.

I don't have any observations from before the damage occurred because I bought the transceiver knowing that it didn't work.

Thanks for any comments.

Bruce, VE1II

Hi Bruce! On receive my fans never come on & heat sink is maybe just above cool. The fan should come on in SSB mode when you press the mike button. You will have to listen because they are in very slow speed. As the rig heats up in transmit they will get faster & cut off when cooled down.

Wayne, If you have two 500HZ filters in the same IF then you don't need one of them so you can remove one of the 500 HZ filters and install your SSB filter. At one time I had a Kenwood 1.8 SSB filter in the 8.83, 500 slot and it worked fine even though the display shows "500" I now have a 250(maybe it's 240) in both the 8.83 and the 455 slots. When they are both engaged it is great!

Wayne,
I use the Inrad 2100Hz filters in both IF's and they are fantastic. I tried the 1800Hz filters the Kenwood rings too much for contesting and I found the Inrad 1800Hz just too narrow for SSB. I also have the Inrad roofing filter kit installed (a must for contesting) and a Kenwood 500Hz filter in the 8.83Mhz IF that works great with the 2100Hz in the 455Khz IF. I am not into SW Broadcast so the narrow roofing filter does not bother me. Get the Inrad filters they have the Kenwood filters beat hands down. The 1800Hz filters are not fun on the ears in a long contest.

Hi Roland.
Thanks for the info, I have been looking at the roofing filter as well, wondering if it would be worth the effort to install. I have an old 850 here that I use for parts and had a look at the installation of the roofing filter, It seems fairly straight forward.
Wondering if I should be putting money into the old rig.
Maybe I should the money into a new 590

Personally, I have found the 1.8 KHz filters too narrow. The 2.1 KHz filter is narrow enough, with any narrower choices resorting to the effective slope controls.

I'll be interested in reading/hearing what others say. 73.

Wayne,
If you are planning to use the 850 for contesting the roofing filter is a must.
The 590 is a great radio I have 3 locals using the 590 and they sound great and the receiver is outstanding due to the DSP and roofing filters. If I had the extra dollars I woud buy the 590 myself but since I don't I'll stick with the 850.

Steve, I am a cw op also. I have 250's (maybe they're 240's) in both IF's (Mine are Kenwood filters). When the 8.83 filter is in, it's great but when I go to both, in the 8.83 and the 455 IF's, everything gets much better! It was money well spent! When using only the 455 IF filter it's almost as good as using both. I highly recommend a 250 (240) in the 455 IF. I also have a 500 in the 8.83 IF. When I'm tuning around looking for DX or trying to pull out the weak ones, I am constantly switching between all filter combinations I have. I believe INRAD also has a narrower filter than 250 but I would think it would be too narrow however I sure would like to try one someday.

I say do it! I always recap tube rigs with the original caps installed.
10-15 years is about as far as an electrolytic cap will last in service.
I just replaced my leaky C104 (TS-450) a few months ago and thought of doing a full cap replacement one day as well.

A great source for caps is here:
http://www.justradios.com/
Dave sells to the tube radio crowd but he should have what you need.
His site is a great tool in its self. Lots of info for sure!

I just looked at Dave's site and... It is for high voltage tube rigs.
16V is probably as high as these newer Kenwoods' would use.

Hi Randy,

Yes, I purchased the rig off of ebay. I just checked it out last night and it seems in great condition (with the exception of some broken pins on one of the filter sockets).

The original owner I purchased the rig from included the original sales receipt and the rig was actually purchased in 1996. Kenwood has confirmed the year of manufacture was 1995 so I guess the serial number conventional wisdom is true.

Topic: 9461 Message: 9934

Hi,

I just read this post lately and want to contribute some info, it might be a solution. I repaired my brother's TS450 in which he complain he is having a problem on weak and intermitent RX, at first i instruct him to check SO239 connection inside and try to resolder it. Still it doesnt solve it. So when i got my hand on the radio i check, i found out that the SO239 center connector on the radio is moving and giving pressure to the wire connected in the SO239 and the PCB board i suspect that the solder under the PCB has a cold solder already. The center of SO239 move every time we remove the coax, like change antenna, change coax connection etc...

So i remove the filter board and check underneat, and its right there is a cold solder causing loss of RX, i improve it by increasing the solder area of the wire to make it more stronger (remove the green paint and expose the copper to solder) After this it worked fine now and the solder connection underneat is ok because of the solder reinforcement.

Hope this helps to other.

Alex

Hi,

I just want to know if someone experience this problem, i tried to search some the same problem in the group forum, i found one topic but not sure if the same problem.

The 850 display is changing the Hz freq. either up or down even not moving the dial, in short the freq display is running? to stop it you need to move the main tuning dial. After a while it will run again. Sort of weird but if happen, can some one give me points where to check or any post number related to this problem.

Me and my brother have a this 850/450/690 in our shack and we love the radio and plan to keep it.

Hope Mr. Cliff will help again.

Thank you,

Alex

9936. Dead Receiver

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-04 05:23:30 UTC
From: w7smj
Topic: 9936 Message: 9936

Hi Group,

I finally put an antenna on my new to me 850 and the receiver is dead. It works as I can tune WWV on 2.5 MHz but it is extremely weak and barely audible. My 2000 is receiving WWV at S7 so I know it's not the antenna.

I did install three optional filters and when installing the filters I noticed two pins on one of the 8.83 MHz filter connectors were broken off. I carefully soldered some wires to act as new pins and I don't believe I hurt anything doing this. Of course it could be the golden soldering iron...

Anyway I have tried the usual suspects, RF Gain, Attenuator, Slope Tuning, SQL with no joy. I removed all of the filters but still no luck.

I have seen mention in the group of Q49 being a possibility or perhaps the glass bead arrestor.

Any ideas or guidance?

Thanks & 73,
Scott

Hi Tom,

There's actually two attenuator buttons to switch in 6dB, 12dB or 18db of attenuation. I have tried all positions with no luck. It sounds like the attenuators are working as the signal fades when they are activated.

Thanks,
Scott

After searching a little more I see that D31 may be a possible failure point. Is D31 on the TRX board? Sorry, I know I should be looking at the service manual for this info...

I saw one thread where low RXB indicates a D31 failure and checking this I read 7.91v so I guess that's probably not the issue???

RF Gain all the way clockwise?

Squelch all way CCW?

AIP out?

Bottom right corner front panel.

Inside knob full clockwise

Outside know full ccw

Go look at your soldering job very closely. Those pins are just ground pins and not needed. They are cut off to use Inrad filters and don't need to be added back for Kenwood.

The RXB is correct so D31 is out.

DO NOT tweak, align, or anything else until you know what the problem is. Alignment does not cure a failed component.

Hi Clif,

Good to know, I guess I should have left well enough alone. That makes sense as it looked like they had been deliberately cut and I couldn't see how they could have broken off during an install or removal...

I'll remove the wires I added and inspect the board carefully to make sure there are no shorts.

Thanks,
Scott

9944. 850s - Power and Carrier controls ???

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-05 16:59:21 UTC
From: dick_na7i
Topic: 9944 Message: 9944

Hello all,

I'm a newbie on this group. I have acquired a used 850s that seems pretty nice, works well at least on receive. I am trying to figure out how the transmit controls work. My experience is only with tube finals (as on my 830s), where you have plate dip, load, etc.

I can figure it out - I guess one just turns it on, sets the mode switches, etc - makes sure the tuner will 'tune' the antenna (it has the built-in tuner), and 'fire away'. BUT:

The manual is pretty lacking in describing exactly what the 'Power' control does, and in just how to read the display meter. I would think that the 'Carrier' control sets cw output power without the need of any separate 'power' control, no? That's how it works on other radios I've used, including my 830s.

With key down (low carrier out), I see TWO lines generated in the meter display - one above the ALC line, one below.

No explanation whatever in the manual.

So my questions: What is the purpose of the 'power' knob? How does it work in cw, and in SSB ? (??)

And, could someone explain how to 'read' the two lines in the meter? I have some guesses, but actual knowledge would help, since there is no discussion in the manual.

Many thanks -

Dick Chaffer NA7I
Bozeman, MT

Welcome to TS-850 ownership Dick,

You will really enjoy your 850. First lets start with the meter, you will notice the meter has 2 segments like you said one above the ALC (Power out) and one below (ALC and SWR). The top one is the receive S meter in the RX mode and when in TX is showing power out. Now for the second part if you will notice the Meter button just to the right of the CAR/Key Speed control if you push that it will change the bottom segment of the meter to read SWR-ALC-Nothing.
Now we get to the Power and CAR controls first is the car control and you guessed right it does control the CW/AM/FSK/FM power out (when using AM turn down to 25W). And the Power control is for SSB/AM operations for AM operations set the CAR to 25W and adjust the power for foward drive if you go too much you will see a backward swing of the power meter or reverse modulation as the 11 meter crowd calls it. When using the Auto Tuner you must have at least 10W of drive power so if the CAR control is turned down too much the Tuner will not tune.

Enjoy the fine rig
Roland AH6RR

Not here using N8LP's pana. with PowersdrIf modified by W2UX. Works great.
In fact if using it for rx it's as good as it gets according to Rob
Sherwood's sherweng.com site. Same as the Flex.

Update on my receiver problem:

I removed the wires I added and inspected the joints with a magnafying glass and there are no shorts, all looks well.

I checked Q49 on the RF board and it looks good, 12V on the output.

I also checked the surge absorber, D16 on the filter board and it looks good.

Any ideas? Should I start working my way backwards on the IF board?

Thanks,
Scott

9951. Slope tuning problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-06 07:50:32 UTC
From: Zack Widup
Topic: 9951 Message: 9951

I think I asked about this some time ago but no one ever answered it. Ever since I got my TS-850 (secondhand), the slope tuning has never been right. I have the 500 Hz 8.83 MHz filter and the 2.7 kHz 8.83 MHz and 455 kHz Kenwood filters in it.

The high-cut slope tuning control goes through a "zero" of low frequency in the three-o'clock position with the CW filter activated. I have used other TS-850's where this "zero" was in a different position, farther counterclockwise. The high-cut control doesn't seem to adequately high cut at all in the CW position. Slope tuning seems OK with the 2.7 kHz filters activated.

I hope that description adequately describes the problem. Any idea what is the cause of this? Bad filter? Is there an internal adjustment to compensate for it?

for slope function corectly you have to insert and activate both 500Hz filters...or
250Hz(8.83) and 500Hz(455)...

I was wondering if it would work with just the 8.83 MHz CW filter. That's the way it came when I bought it. I'm guessing the previous owner wasn't a big CW operator.

So I guess I also need to get the 455 kHz CW filter?

My 850 manual has all this in it. It says to use the CAR control for CW, to have the ALC meter go to the end of it's red segment, then the power control is your power out. Also the meter button has one more function, the compression level. It works only when you have the COMP on.
You must have some pages missing out of your manual or Kenwood left it out on later runs????? Bob WE6C

yes...
I am using 500Hz in 455 slot and 500+250Hz in 8.83 slot...most of the time using 500+500,and on crowded bands(contests,etc.)500+250...slope works very,very good with this combination...

I find the slope tuning varies on the filters used. I have similar to (1.8 FILTERSSB INSTEAD), and my slope tuning works fine, BUT it also depends on you switch settings (under the little panel on top)

maybe check those

sw 4 or 3 for cw filter, look at the label for correct sw on for narr or reg cw filter

sw2 no connection

sw1 for the 455 filter

if these are not set correct, the filter will not vary (noticably)

I also wonder if your 2.7 filter would be part of the cause.

Dave

Here's what I found with my 850 and 2.1Khz SSB and 500hz filter in the 8.83Mhz IF and the 455 filled with a 2.1Khz filter. Looking on the waterfall of HRD DM780 with the 2.1 filters engauged I get full control of slope bothe hi and low but when I use the 500Hz filter only the high side works.

Guess I'll have to get me a 500 Hz filter for 455 kHz. Maybe I can
talk Santa into bringing me one this year.

HI Zack

If you can get one, the Inrad filters are much better than the Kenwood. I have a 400 and 250 cycle Inrads and they really work good. I have a kenwood 500 cycle in the 2nd radio and it seems much wider than 500 cycles. 73

Hi group,

I decided to start from the front end and looked at Q2 & Q3. From my poor copy of the service manual it looks to me like they should have 2V on the source, 0V on the gates and 9.8V on the drains.

I have measured 0V source, 0V gate and 9.96V drain. That obviously looks suspect. Does this indicate Q1 & Q2 are bad or possibly C105 and/or C106 are shorted?

Hopefully tomorrow I'll have some time to measure Q1 voltages...

Thanks for any help!
Scott

Hi all,
When i use psk with home build interface for audio on the ACC2 bus and switch the ptt on the ACC 2 bus the mic is muted.
But when i want to do PTT via tha Ham Radio de Luxe program and DM780, does anyone know if the mic is also muted then?
I make a cat interface for ts450s with two opto couplers 4n27, as simple as possible, any problems with that so far that you know?

Yes, that's what I was thinking. I believe Inrad has a sale some time
early each year, too.

Q2 and Q3 are a preamp used above 22 MHz.

Q1 is used below.

if you run to pin 9 for ptt, then diode to pin 13, I beleive the mic DOES
get muted.....

have someone listen to you psk, while you yell in the mike

9973. TS850SAT UK Based with DSP-100 & SP31 Speaker Forsale Must go soon

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-08 20:32:47 UTC
From: Jay Knight
Topic: 9973 Message: 9973

Hiya all I need to sell my faithfull TS-850S with the ATU add in and DSP-100 Unit because i've been offered a TS-2000 which I need as I work alot of portable and field day contests. I know that the 850 knocks spots off the 2000 on RX but this is the radio I really need at the moment.

My 850 id in VGC with the rare DSP-100 unit and all cables and also includes the SP-31 noise cancelling speaker and fist Mic (keeping the sesk mic). On ebay recently just the DSP-100 fetched £698 but I value my complete set up at around the £900 mark as it's in such good condition and has been unmolested.

If anyone in the UK or Europe is interested in buying or trading for a TS 2000 please email me and we can have a deal. My email is M6JPK@...

I also have an unopened LF-30A Low Pass Filter to include aswell.

Any one with plans for making a homebrew data cable for HRD control and datamodes it would be greatlt appreciated.

73's de Jay M6JPK

9975. TS-850S 13 pin DIN will not fit ACC 2 Port

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-09 04:58:49 UTC
From: k4zot
Topic: 9975 Message: 9975

I just received my new TS-850S and I am very pleased with its performance especially the audio reports I have gotten. I hooked up HRD and CAT also works well (6 pin DIN). So when I got to hooking up my SignaLink USB for PSK31 I had to buy a new interface cable from Tigertronics to plug into the TS-850S 13 pin DIN ACC 2 Port, but it just will not push all the way in and seat. I checked each of the 13 female connectors in the rear and everyone is open to a paper clip. But the connector wil not seat all the way something is blocking it. I even tried a second 13 DIN same results. What could be blocking the conector if all the pins are clear? Need some advise on what to check?

Also, can I get to the 13 DIN connector from inside the 850 or is it oovered by circuit boards. I have not opened it up.

Thanks,

Glenn

9976. MC-60 Mic Setting and Amp?

What is the recommended Imp. setting on the MC-60 mic - 50K or 500 (the small switch on the side of the mic)?

Also, what is the difference between the MC-60 and MC-60A.

Last, is the MC-60 Mic Amp useful (bottom base switch) and how does it work with the 850's High Boost and Proc?

Thanks,

Glenn - K4ZOT

If more than one connector will not fit, then I would suspect there may be
something in the socket.

I know from mine, the connector has to be squarely pushed to fit.....

good luck

I noticed that happened here to the connectors on both radios.

You have to be really sure that the pins on the plug are straight. If they
are just a little crooked they don't want to install into the socket. Once
you get it in right, it works fine after that. 73

I found that on mine it was the metal shell or casing that was the problem in getting the plug to seat properly, The casing was not quite round, Had to slide the plastic cover back a little and squeeze the two halves of the case together to get it to fit.

Cheers Wayne

OK, I finally got it after a great deal of twisting, turning and jiggling of the connector. PSK31 works great. Thanks for the help.

How much should be the voltage at pin 1 of Z10? 6V or 2.8V. I have the 2.8V - the same as pt1....

The problem is still not solved...
I think it's an agc issue. agc off and on is no difference in audio. I can switch the agc button: no difference in audio. The time select of ic 10 is working (pin 5, 12 and 13). How can I checke (voltage) if agc is on or off?

David

9985. Replacing the final ampl driver transistors in a TS-450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-10 22:20:39 UTC
From: wa4pub@aol.com
Topic: 9985 Message: 9985

Hello to the group!

I'm repairing a TS-450S for a disabled friend and colleague. He has had it in the shop before but, it had low - no power output. So it's my turn to give it a try.

I found that it had defective Q2 & Q3 driver transistors (type 2SC2509). I've ordered, and since received a new pair from RF Parts Co. They sent me a matched pair of 2SC1945; the originals are no longer available.

They also sent me circuit modification information as follows:
a) "SWAMP B-B W/ 15 OHMS"
b) "REDUCE F.B. RES TO 100 OHMS"

I understand what's being said in item a. However, I would appreciate any comments or directions from the group as to the implementation of item b, which I can't understand, especially when I look at Kenwood's Circuit Diagram (HF 100 W FINAL UNIT (X45-3400-01).

I don't want to risk blowing up the new expensive drivers, so ...

In the Q2, Q3 driver stage itself, I replaced R8 & R9, C7 & C8 and rewound L6 & L7 in the feedback circuit. I also replaced the 15 ohm bias resistors, R6 & R7.

I have checked out the Q6 BIAS DRIVE transistor. Q6 is good! I also replaced capacitors C14, C15 & C16. VR1 was replaced. Resistors R22, R23 & R24 are "dead on." Thermistor D2 checks OK (by the data sheets). Choke L5 & L8 are OK. All etched traces check OK.

I have gone to the extreme of replacing all of the electrolytic caps on the 14 &
14S supply busses on the circuit bus since the rig is pretty old.

I want you to know that I appreciate any and all comments and information the group can provide. You can email me separately, if you so desire. _wa4pub@..._ (mailto:wa4pub@...)

Many thanks and MERRY CHRISTMAS TO ALL!

Dave - WA4PUB

Why didn't you use the 2509's from Kenwood??? $46 for a pair and no circuit mods.

"B" refers to R8, R9.

Thanks for the quick response, Clif.

I didn't know that Kenwood had (2SC2509) replacement trans at such a good price. Oh well ...
That's why I went to RF Parts. I'll know better the next time.

Thanks for the clarification of item b "REDUCE F.B. RES TO 100 OHMS" When I read "F.B.", I took it to mean "Forward Bias" instead of "Feed Back".
Early on, I was considering changing R8 & R9 from 180 ohms to 150 ohms.
But, I didn't because I was worried about too great a reduction in stage gain.
However, thanks to your clarification, I will go ahead and change R8 & R9 to 100 ohms.

I really appreciate you're being there for me and the group!

Regards,

Dave - WA4PUB

Hi David..I had an issue with ALC...
all caps on small AGC board(bottom side of TS-850S) replaced...
if they are with blue dot mark on top replace them all soon as possible
clean the board with acetone and then recap the whole board...
I think there is small value one 0.22uF or something..put ceramic or silver mica one...not ELECLTROLITIC...

Hello!

I would NOT use acetone, as it is, IMHO, too strong. I always use alcohol (medical kind, 96º) to clean capacitor residue and it has worked fine for about 20 TS-850S CAR UNITs so far.

Best regards,

JOSE

Thanks for the answer
I loaded a photo from the agc-board into the Photos section (Folder: TS-850 HB9RVS). On the c's are no blue dots. I thought there is only a problem with the electrolytic capacitor. Which one ist the most critical on the board? Maybe I will resolder one an check it with my lc-meter.

What are you using to generate a signal that should be giving an s-meter reading? It may be deaf as a post....

Hi Clif
I take a Elecraft XG2 and give 50uV (@ 7.060 MHz) to the antenna connector. This produces with the 2.7kHz filter about S4 (should be S9). With the 500Hz filter no deflection....

Ok, that says the AGC circuit is fine. It's working with the 2.7 filter so the radio is probably deaf as a post. Oh and the CW filter has a problem also.

The XG-2 has 2 levels, what does it do on the 1uv setting? It should be loud and clear. If not quit looking at the AGC and fix the rx. Try the other bands also and see if you get the same???

Hi Clif
On 40m is 1uV nearly not hearable. On 20 and 80m: 1uV is not hearable; with 2.7kHz filter: no s-meter deflection.

Yep, deaf as a post. Check the filter diodes first and then Q49. After that????

9997. MC-60 Mic Setting - 50K or 500 Imp.?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-15 04:16:25 UTC
From: k4zot
Topic: 9997 Message: 9997

I have read confusing comments on the right MC-60 mic setting - 50K or 500. What is the opinion of the group? Which setting on the mic is best to use with the 850?

Thanks,

Glenn K4ZOT

9998. Re: [TS-850_450_690] MC-60 Mic Setting - 50K or 500 Imp.?

I know its been a while since I had a mc-60, did it have a choice??? I know the mc50 did, anyway 850 uses LOW impedence so 500 or 600 ohm is good..

Sorry, I could have been more clear.

The rx BPF diodes on the RF unit short and cause problems. Q49 is an attenuator on the RF unit that is turned on in tx to protect the front end. When it shorts it causes about 20db of attenuation.

Check msg 9726.

About the MC-50 -

This is interesting. I have my original MC-50 sitting here, it has three switches: PTT, Lock (for PTT), and an on-off on the mike cylinder itself. There appears to be no impedance selector, unless it is inside.

Of course, I've long-since lost the MC-50 manual. I suppose it's on here somewhere.

I also have a 2nd hand 850s and a hand mike for it. Unfortunately, the MC-50 connector will not fit the 850's socket. The guy I got it from kept his MC-60, which he said had an audio preamp in it.

I'm reluctant to simply try to find - or make - a connector 'adapter' for the MC-50; there may be some very good reason why it will not fit the 850 connector.

mc50 is set by how the cable is plugged in the mike...

kenwood did have adapters (hard to find now) mj-48 for 4 pin to 8 pin, that way you did not have to butcher the connector, by trying to resolder it

I use one here, and they do make it easy. you can also find 4 pin inline to match your connector, and wire to 8 pin for the 850 .... done that too...

I have the manual in pdf if you want a copy.....

the only good reason is that after the hybrids they changed most mikes on the Kenwoods to 8 pin... adapt away

Dick,

The MC-50 impedance selection is made by different orientations of the plug on the cord between the microphone base and the rig. I attached the MC-50 manual for your reference. Since the reflector will strip the attachment I sent it to your direct e-mail address.

The MC-50 will work on your TS-850 if you build/buy the proper 4/8 pin adapter. I can provide the wiring diagram if you want to give it a try.

I use my old MC-50 on my TS-450, it works fine. The "switch" is the plug on the back of the MC-50, look at the red dot on the plug, my red dot is in alignment with a red dot on the mic itself. I had to change the plug that mates the 450.

The MC-50 has 2 impedance settings on the mic it's self. If you look at where the plug is inserted in the rear of the mic you will see a H and a L. H=50K and L=600 ohm for all Kenwoods except the 520/820/599 use th L 600ohm setting. The MC-50 is a very good microphone.

You guys are all exactly right. I checked my MC-50 and it does indeed have those dots. Now, of course, I have a very dim old memory of lining them up a certain way for some reason (??) - they are set for 'high' z.

A kind soul sent me a diagram for 4-pin to 8-pin, and I found a new 8-pin plug and 4-pin socket at Rat Shack, of all places. So I've got another little project now, building a short adapter cord.

Thanks for the tips.

OK, still confused - so the TS-850S MC-60A should be 500 ohms - Right!

I'll check it tomorrow but I'm not sure. The api and both att stage are switchable...

Glenn, The 850 uses the lower impedance. When I got my MC-50, I wired it for the 850 then got on the air with a friend and got an audio report. My mic is in the position where my friend said the audio was best. I assume it's in the low Z position but that was more than 10 years ago so I don't remember for sure.

OK, still confused - so the TS-850S MC-60A should be 500 ohms - Right!

I am using an MC-60 on my TS-690. Pre-Amp ON.

Both 500 and 50K works fine.
Almost no noticeable difference.

The MC-50 has 2 impedance settings on the mic it's self. If you look at where the plug is inserted in the rear of the mic you will see a H and a L. H=50K and L=600 ohm for all Kenwoods except the 520/820/599 use th L 600ohm setting. The MC-50 is a very good microphone.

10014. RF gain acting odd

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-18 15:07:52 UTC
From: Kurt Cathcart
Topic: 10014 Message: 10014

I have a TS-450. When I use the RF gain i turn down from 10 to a lower number. When I do this, the S-meter shoots up to between 40 and 60 over S9 then settles down to where it should be several seconds later. If I then move it a little more, the S-meter shoots up again and settles in again. Does anybody have an idea as to what this problem might be?

Kurt, On my 850, if I turn the RF gain clockwise to attenuate the signal, the S-meter goes up like yours but I don't believe it settles back down. I'll try it tonight and see.

Is there any possibility to switch OFF the "dot-dash memory" in the keyer??(IAMBIC B to IAMBIC A)
any mod or something???
I can't find anything out there for that...
After 20 years CW without dot-dash memory hardly can do it with...:))
All the time I using external keyer...
maybe some explanations of I/O pins on keyer MCU...
tnx in advance....

No, that turns off the keyer function so you can send with a hand key or bug.

I thought that is what was meant, so maybe the hidden menu item 24 is more towards the answer (see pg 23 and 24 of the manual

I assumed the electronic function would make his keyer (external) do the iambic patterns instead of the internal choice..

I think he wants to use the internal iambic keyer in mode A and it's set for mode B. I believe the internal iambic keyer can be switched from Iambic B to Iambic A mode. I wold have to look at the manual on the control modes to see for sure.

You're right; there's nothing about that in the manual. The closest thing is setting auto-weighting to off (menu # 21) and selecting manual weight (menu # 23). You enter this menu mode by pressing and holding LSB/USB key while turning the power on, then rotating the M.CH/VFO CH knob to select the menu. Escape it by pressing CLR.

10025. Re: [TS-850_450_690] Re: TS-850s CW keyer

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-21 04:14:33 UTC
From: Chuck Goelz
Topic: 10018 Message: 10025

I thought he was asking for a way to configure it for non-Iambic mode... Just a standard (well, what I considered standard 40 years ago) keyer, with nothing more than self-completing dits and dahs... Kind of like what I use now (but it's external). I guess we need more detail from him to understand his request???

Since the keyer IC is a 4 bit processor with internal ROM and RAM and not a "keyer IC" I don't see to many ways to change it except for getting the code and changing it and burning another IC.

Yes Cliff...I can see on datasheet of MCU... it is internal mask ROM(75P008) CPU...
maybe code writer for that MCU in ts-850 make some I/O on this MCU to switch between this two modes...:))
that was my intention...maybe somebody tried something...anyway tnx for the answers...I'll keep my K9CW keyer...:))

Topic: 10018 Message: 10028

I suspect if you can't use the internal keyer in the radio, the only alternative is to use an external keyer. I like the K1EL K10 keyer.

Also, K9CW has been a longtime friend of mine since college and he now lives about 15 miles from me. I got to build that keyer when he first designed it!

10029. Ts-450sat cuts out when transmitting

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-22 18:40:13 UTC
From: john ferro
Topic: 10029 Message: 10029

i have a ts-450sat that just cuts out during transmit. - full power out, i'm talking into the mic and the radio just goes dead. turn the radio to off position, wait 15 - 30 seconds and it turns back on. has anyone experienced this?? thanks in advance.

thx, john

Hello John,

Need more information to find your problem. Please answer the questions below and forward it to me direct,
1. By dead, do you mean the whole radio goes dead? No RX as well, just dark radio?
2. Does your power supply have metes on it? If so, how much current is radio drawing during TX and how big (in amp rating) is your power supply?
3. Please try to give more information in general and I will try to help you.

73, Bruce, W8HW
w8hw@...
Hams helping hams become radio-active.
I buy and-or fix broke radios.

Hi,
I haven't experienced that on my TS-450 but did experience such a thing on a TS-530. On the 530 I finally found there was a cold solder joint where
one of the 6146 final amp tube's socket soldered to the PC board. The TS-530 was probably Kenwood's first effort at using a PC Board in the final amp compartment and the quality was sub-par. Inspect your radio closely for evidence of a dis-colored solder joint...you could have a similar problem.

I had an engineering manager friend that was with a management group touring Japanese manufacturing plants in the early nineties. That was when the big thing was to become ISO 9000 compliant with your manufacturing effort. ISO 9000 was a major industry effort to assure that the highest quality standards were observed in manufacturing ... I hear groans from many of you that had to jump through hoops to meet those requirements. All the gibberish to say this...at the time of that tour Yaesu was the only one of the big three ham equipment manufacturers that had met ISO 9000 requirements at that time. According to my friend, Kenwood seemed to be the least compliant at that time. Both my friend and I own and enjoy Kenwood equipment though and I am certain quality has improved across the lines of every manufacturer since then.

Yes. Be sure to check this. If there is a knob that adjusts the voltage or amps on the PS, make sure it hasn't gotten bumped. That has happened to me before. When I would hit the transmitter, the whole radio cut off.

If you don't have knobs, and have another power supply, check that out. If you don't try the car battery. 73 and GL

check the power supply.....

How true. I once had a choice between two GE MASTRII repeaters and both came out of active service fully operational. The first one I tried would cut out on high power. Then the second one did the same thing. After scratching my head for a while, I discovered that by moving around I had bumped the current limit control on the power supply.

Once I re-adjusted it, both repeaters worked great. So..... I took the cleanest one and it performs flawlessly. Lesson learned was to move the power supply in a spot where I would not accidentally be able to bump the Voltage and current limit controls. I never had this happen again.

It might be a over kill but I use the P'n play cable from the 704 to the 450, only one place it will plug into at the 450 and then the RCA plug cable between relay connectors of the 704 and the amp. You can't hurt the amp with the 704 & ALC hooked up so it is good insurance for the AMP , IMO.

10044. TS850, Inrad filters & slope tuning

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-26 00:57:42 UTC
From: villy.madsen
Topic: 10044 Message: 10044

I just installed a couple of inrad 2.1 khz filters.

in upper or lower sb setting - everything seems to work ok - the slope works as expected.

in cw mode if I select the 2 built-in 2.7 Khz filters, or one of the 2.7 and one of the 2.1 filters, it seems to work ok,

but if I select both of the 2.1 khz filters - then the slope tuning doesn't appear to do much of anything..

CW pitch is set to 800hz

the 8.8mhz inrad is in the leftmost slot (furthest away from the 455khz filters)- so it shows up as a 500hz filter on the front panel - as does the 2.1khz 455 filter.

Does anyone have any thoughts ???

Villy,

My 2.8 KHz INRAD filters in both IF's work tremendously when I use the either the high or low-cut slope feature. They are in the 8.83 MHz "270" and 455 KHz "500" slots. Install them there.

Oh, I also have an INRAD 400 Hz CW filter in the other 8.83 MHz slot -- the "500" location.

Good luck -- the INRAD filters are great.

I think the 2nd filter has to be one of the cw filters, for the slope to be working

check your dipswitch settings under the top cover, they may be set wrong

and do you have the 455 filter installed..

Thanks Dave

I did move the filter
and things to appear to be working fine - but I am not sure whether it was that change, or just me taking a second look at how things are working.

In the event, I'm not changing things back to verify that <G>.

One thing that I do know, is that I probably won't bother with the CW filter (which I had thought about buying) the 2.1s in the 8mhz & 455khz slots with slope tuning would appear to oviate that requirement

Villy,

Glad to hear they're working okay now. I also believe the 2.1 KHz filter pair should suffice, when narrowed down by the slopes, for most all modes.

Note: I found that to be the case when I op'd a TS-830S with matching 2.1 KHz filters in both IF's, to include the filter switch kit that switched in the original Murata filters for transmit.

Please tell us the final configuration that worked for you -- slots and dip switch settings. I bet they're the same as my rig with the matching 2.8 KHz filters, but I'd like to compare notes, as I may try the 2.1 KHz filters myself soon.

Thanks.

Steve,
I have been using the 2.1 Inrads in both IF's for a couple of years now they are much better than the 1.8 and 2.4 and when combined with the Inrad Roofing filter kit they are outstanding in a contest/crowded band. I also have a 500hz cw filter that is also great for the same conditions. The slope tune is good but when a BIG GUN moves in close you have to move unless you have the roofing filter but if they get within 3 khz it's time to move anything over 3khz and not a scratch unless they are +30over 9.

10050. TS850 optimum filters for SSB?

Yahoo group: TS-850_450_690 (2010 — 2016)

I don't do digital or CW. Looking to see if there are any filter changes you would recomend for general rag chewing. The slope tune is great but sometimes I would like to cut a near by station better. I see Inrad has the 2.8 & 2.1 along with a roofing filter. What (If any or all) filters would you suggest? Can they be installed to where I could switch between the 2.1 and 2.7(Factory) or 2.8 ? Would I be better off with just the roofing filter? Maybe no roofing filter but go with the 2.1 or 2.8?
Thanks for any help , Mike

Aloha Mike,
I have the Inrad 2.1 filters in both IF's and the Roofing filter and the combanation is outstanding. I can get within 3khz of a s9 signal with no scratch at all S9+10 very little scratch. I use my radio for contesting, DXing and rag chewing. Once the roofing filter is installed the AM broadcasting receive is somewhat degraded due to the fact the roofing filter is 5-6khz wide. You can swtich to the factory filters with the inrads installed. Try the 2.1 filters first then if you feel you need too add the roofing filter.
Enjoy the fine radio Mike.

Thanks Roland. I need to send the rig to AVVID to repair the RX but I think I'll wait until the filters come in and then send it to him and have him install the filters while he is in there.

10053. TS 850 S Display board.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-28 16:50:23 UTC

Hi All and thanks for reading my post.

I bought an 850 on xmas eve, things have been tight money wise for a while, and it took me a good time to afford the radio..

Today, just after working 7Z1CQ, the display started to flash when turning the VFO knob.

I searched the web and found http://jvgavila.com/wb7.htm

I've replaced the cap, now the display has failed altogether.

Couple of questions please.
1) Does anyone know where I could get hold of a Display (working that is!!) board?

2) do you think that the original display board may be repaired?

I love the 850, it's a beautiful radio, and I really don't want to lose my money or send another classic to Rig Heaven.

Thanks for any advice offered.

Hi,
When you replaced the capacitor had the leakage eaten away any PC board traces. When replacing this capacitor it is common to also have to repair land patterns that have been eaten away by the leakage from the cap. That might be why it has failed completely now.

Did you follow his direction and clean the board and verify the connections? Just replacing the cap won't do. He has excellent pictures of what to look for BTW.

If the cap had leaked, it may have destroyed part of the trace, also make
sure your cap is NOT in backwards

check your work, it was working, so it should be at least working the same
as it was before.\

Hello Kev,

I am sorry if my WEB info misleaded you. As Clif comments, you need to carefully clean leaked electrolyte and check PCB traces, both the larger ones on the capacitor side AND the small ones at the other side. Note also that the replaced capacitor is mounted on traces which could be damaged. If you install it as I show in my WEB, it is easier to scrap traces and add some soldering to fix them. Depending on damage, I install the cap vertical or not.

I have fixed about a dozen units so far, and most had the small trace opened. And, yes, almost always is a fixable damage.

Best regards,

JOSE

10058. ALC on TS950

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2010-12-29 09:31:44 UTC
From: Patrick Egloff
Topic: 10058 Message: 10058

Hi all,

A friend of mine bought a TS950S from an old ham. Everything is working fine, except that the output power on SSB is around 40-50W.
CW and FM are giving full power.
The seller told my friend that he modified something around the ALC 20 years ago, but has forgotten what he did !

Has anyone a guess what could be the mod/adjustement to do to bring the full power back in SSB ?

Thanks and season greetings,
Patrick

some of the other rigs used to have a slide switch/dip switch internal for dropping the power, maybe the 950 has that as well, check the manual

Topic: 10060 Message: 10060

I have a TS850SAT and can not get the CW keyer o setup.
Is the keyer an option to install. The menue items 21 and 22 do not show up when the menue is activated. Any help?
73, John

That power reading is about right if he not using a peak reading meter.

did you slide the switch on the rear. also it only switches between
straight key and paddle (dit dah) you have to have the electronic keyer
external to the radio

John, did you slide the "Electronic Key" switch on the back of the rig to "On"?

John,

I don't quite know what Dave can be referring to.

Isn't there a knob on the front panel, dual knob with 'carrier', to control 'key speed'? That seems to indicate that the keyer is internal, built-in. At least, that's how it is on my 850SAT.

When I plug in a paddle set (three wire plug), and set the slide switch, I get normal keying from dit and dah paddles. Speed is adjustable as stated.

Yes. When that switch is off, you just transmit when the tip of the plug is grounded, for hand keying, bug or external keyer (BTW, hope to work some of you in Straight Key Night!). Also, when that switch is off, menu items 21 and and 24 don't show up.

There is a switch on the back near the key jack. When you switch that to on and the menu functions 21 and 22 should show up. I don't know if you have to power down and back on after switching, so if they do not show up, try that.

You will use a stereo plug, not a mono as one side is dit the other dah then ground. The instruction manual in in the files section of this group, so all this info should be there.

No, you don't have to power up again. If you're in the menu mode and switch that switch to the straight key position, those menu items disappear. If you put the switch in the keyer position, they reappear. I just tried it.

The slope tune is great but sometimes I would like to cut a near by station better. I see Inrad has the 2.8 & 2.1 along with a roofing filter. What (If any or all) filters would you suggest? Can they be installed to where I could switch between the 2.1 and 2.7(Factory) or 2.8 ? Would I be better off with just the roofing filter? Maybe no roofing filter but go with the 2.1 or 2.8?
> Thanks for any help , Mike
>

Hi

Over a year ago also was wondering which filter would be best. I was looking mainly to filter DXing and contesting. As a result, I bought two filters: Inrad 2.1 kHz and 1.8 kHz original Kenwood (both on 8.83 MHz IF).
For rag chewing and DXing in my opinion is better 2.1 kHz.

For very weak signals when splater is not a problem (only noise and QRN), 2.1 kHz often improves the clarity of the signal, compared to the factory 2.7 kHz, in particular on the low bands. With 1.8 it is not obvious.

When the received signal is strong, but prevent us splater, both are better than the factory 2.7 k.

In contesting (a powerful signal, a huge splater), I see no big differences between 2.1 kHz and 1.8 kHz, because both are for me ... too wide. Using Slope Tune I narrow bandwidth up to 1.4 kHz (300Hz to 1700Hz on waterfall).

I should mention that my TS-850 is equipped with Inrad roofing filter.

I have a TS-850S and am using HRD CAT. Yesterday for the first time I could click on the HRD logbook DX Cluster spot and the radio would tune to the frequency. It never work before yesterday. Today I could not get it to do it. Some how I must have changed some setting or ? Does anyone have a suggestion on what I can do to get back my automatic DX Cluster spot tuning. It was really neat while it lasted. I'm not sure what turns it on or off?

Make sure
A) that you link to the radio is ok(see if you can read the frequency correctly.
B) that you logged in the DX cluster, this is not done automatically (top row of the DX cluster window)

Unfortunatly I cannot send some screens capture as I am actually touring in south Chile (CE7/F6DXE) and have another set (IC7000) with me and no HRD active

Glenn,
HRD can be set-up to either double click or single click to go to the cluster spot. I should work all the time. First what version of HRD are you running 4 or 5? I use ver 5, on the logbook page with the cluster open the cluster options and goto the selection tab here you can chose single or double click. It should work all the time. If not check your interface. This feature has worked with the Kenwood IF-232 and the G4ZLP interfaces for me for at least 7 years now.

10074. 850 internal keyer backwards...

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-04 12:29:59 UTC
From: na7i_dick
Topic: 10074 Message: 10074

Hello -

Still getting to know my 2nd hand 850s...

When using paddles, I've discovered that the 850s puts dashes on the left paddle and dots on the right - opposite to that which my paddles and home-brew keyer use. When using paddles years ago, I had gotten used to having dashes on the right and dots on the left. I still greatly prefer this setup.

Short of rewiring my paddles, I can find no solution. I looked in the manual for a startup 'switch' to reverse this, but there appears to be no such option. The 'reverse cw' switch does not affect the problem - I think 'reverse cw' deals with some other effect (which sideband..?).

Comments would be welcome. Thank you.

Your radio must be in VFO mode. If your frequency is set through a memory channel, HRD won't be able to change the frequency.

Push the M>VFO button and then try to click a DX spot.

Unfortunately, this is not the case at all.

Both of my sets of paddles are commercial - one is a standard Bencher, the other by Vibroplex, obtained at Dayton 2009.

The keyer is not really 'homebrew' either - it was built long ago using CMOS from an article in QST or somewhere.

ALL of these work normally with my TS-830s. BOTH paddle sets work backwards, as I described, with the 850s.

That's why I suspected an internal 'switch' option, but cannot find one.

Dick, the 1/4 inch stereo phone plug has 3 conductors -- tip, ring, and sleeve. The sleeve is the common (ground). The tip and ring are connected to whichever paddle you chose when you connected the other end of that cable to the Bencher paddle (my Bencher did not come pre-connected -- I went to the nearby and friendly Radio Shack store and bought a several foot long stereo cable -- cut and fit it to my paddle.

I'm certain you recognize that all this means is you can change the wiring on your paddle plug, on the paddle, or if you really want to, on the keyer jack in the back of the radio to make it how you want. There's no warranty issue involved (any more).

It would be nice, wouldn't it, if Kenwood had given you a menu option to reverse the dit and dah paddle lines. I suspect they thought anyone who wanted it reversed could just change the wires on their paddles.

you are talking apples and oranges...you can set the 850 to work with the EXTERNAL keyer like you do on the 830....or use the internal keyer.....but if you do the paddles are the reverse of what the 850 expects....those paddles most likely work on your other keyer if it has an option to work "reverse"

If you built the keyer yourself, just wire it so it has the same
configuration that the TS-850 has.

I did this with a K1EL keyer chip. The connections to the plug are the
same as those on my 850. I can use either with the plug from the keyer
paddle without changing anything.

The K1EL keyer does provide that you can swap the paddle connections
internally, but I don't use it.

Dick,

I'm pretty new to CW and certainly no expert. But the more I read about keyer paddles, the more apparent it is that the 'right' way to wire them is the way you prefer. Left handers sometimes wire them 'backwards' and some people learned one way and some another.

A simple solution that I've seen espoused is to wire a short connection between a stereo jack and a stereo plug where you just reverse the connections for the plugs (i.e. tip wired to ring and vice versa). That way you can key the way you like and the radio never knows the difference.

Good luck and 73.

Hello to all, I'm new to the group. My main rig is a FT-990. I'm sort of a Kenwood guy though. I love my TS-430S,I can listen to it all day long which is one of the reasons I'm not jumping to get a DSP audio based rig. The 990, not quite as long. Just wondering if anyone out there has had a chance to compare both with their similar features, and why they might have stuck with one over the other. I have a chance at acquiring a 850.Oh yes,I,m not a contester, just casual DX and rag chewing on CW.

Glenn,

I have the same setup but I made my own jumper block.
Actually, I use the Signalink with multiple radios not just my 450S.

I took an extra IC header (just like the one installed in the Signalink for the jumpers) and permanently soldered some jumpers to that.
The only difference was on the Mic jumper. I soldered in a nominal resistor that would allow me to set the TX pot on the signalink mid range. (For my 450, this was 330ohms).
This was done for each radio so I can just change the cable and jumper header block.

This has worked like a charm and really easy to do. It is also "set and forget".
Just in case, there is a Yahoo User Group for the Signalink as well.
I posted photos of my jumper block in the photos section there.
BTW, shortly after I posted them, Tigertronics started selling jumper blocks...

Thanks for all the comments. You pretty much answered my question - I was looking for some simple way to reverse the protocol, without rewiring the paddles. If I rewire them, then they're 'backwards' on the 830 - unless I also switch connections inside my little keyer.

Come to think of it, you-all might be right about having to wire the paddles after purchasing. The Bencher was purchased at least 20 yrs ago, and I can see that I did wire it myself. The Vibro was picked up at Dayton in 2009, and indeed, I wired that one too, after finding some scrap shielded 3-conductor cable.

I just thought there might be a 'switch' that would be an easy fix.

Thanks to all who replied.

Or you could get

a Stereo jack plug,
an inline stereo socket and
a length of 3 core cable.

A few mins with a soldering iron will give you a left-to-right converter.

My TS450S/AT has developed a problem recently. It will no longer transmit on any frequency higher than 21.500 (with or without the ATU on).

The problem began intermittently about 3 months ago but now does not tx at all (on any mode).

Anyone experience this sort of thing?

I just ordered a TS480 but would like to keep the 450 as a backup rig so long as the repair isn't too costly (I bought the rig about a year and a half ago for about $450...).

Any information/advice is most appreciated.

Hello David, I solved in some way the same problem on TS-870, even with a simple SDR-IQ receiver. I do not know, how the IF on 8.83MHz is done on TS-850, but I suppose it is similar. See my post on TS870 forum on Yahoo.
http://groups.yahoo.com/group/KENWOODTS870/message/495

The main problem is, if the IF zero 8.8305MHz is a good place for receiving due to the problems with the gain curve. It seems that a certain offset is better. In case that the IF output offers about 1MHz wide bandwidth there is a lots of place for experimenting.

Regards,
OK1VAW, Vojtech.

10096. Converter for the TS-450 IF output

HI all

I found this website . . .

http://ea1ghe.blogspot.com/2008/05/receiving-drm-with-kenwood-ts-450sii.html

. . . which describes how to use the TS-450 IF out from the DSP 2 socket do recieve DRM. He built a convertor to change the 36.891khz to 12khz. (the Circuit diag is in the pdf from that page).

My question is, is it possible to make a similar convertor to convert the 36.891khz to 8.83Mhz? and if so would it be wide enough to be useful to connect to a panadapter or sdr etc?

Many thanks for reading

Hello Jean-Pierre,

I have a TS450SAT as well but because we are refurbishing my shack
right now it's stored away in the basement.

When you tune the HF bands manually (outside the ham bands)
there are certain frequencies where you can recognize a clicking
sound from the inside, but not too loud. I guess that the internal controller switches to a different bandpass filter when your vfo
gets across that distinct frequency.

I am sorry that I cant verify this fact rigth now.

How well does your rig receive above 21.500?

Hi and a happy new year!
I checked IC1 (according message 9726) and this seams to be ok. I checked every diode and they are ok.
I checked q49 too. The collector voltage is about 11.8V and txb is 0V. Q49 seams to be ok.
I compared the rx sensitivity with my old TS-830. I used the XG2 from Elecraft. TS-830: 50uV gives S9 and 1uV no S-meter deflection but is clear herable. Compared with the TS-850: 50uV gives about S5-6 and 1uV is very low herable. This means there is definitvly somthing wrong. The good side: the TS-850 receiver is very noiseless.....(but I like to have a little bit more noise...)

10102. Acc 2 pin numbering

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-10 04:51:02 UTC
From: n2tbp
Topic: 10102 Message: 10102

I'm confused as to the pin numbering of the 13 pin ACC2 jack.
Page 18 of the manual lists the pin numbers and their functions, but is this looking into the jack on the rear of the radio, or is this looking into the plug from the radio??? It says "View from the rear panel", but that still has me wondering. I suspect that the diagram as shown is from the solder side of a plug that was being wired. Anyone can clear this up for me? Thanks in advance.

10104. TS850 and RTTY

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-10 16:34:14 UTC
From: villy.madsen
Topic: 10104 Message: 10104

Took part in the ARRL RTTY roundup this weekend. Didn't give it all of the time that I could, but got close.

I've played in a few rtty contests before, but this is the first one that I got the least bit serious about.

If anyone is interested, the score is shown below. I should have got up earlier Sunday Morning, 80 was really hot! DX was not (for me at least). KL & KH, a couple of places in the Carib & Spain was about it...

Band QSOs Pts Sec Cty
3.5 53 53 4 0
7 86 86 7 0
14 148 148 14 3
21 117 117 27 9
Total 404 404 52 12
Score: 25,856

On to TS-850 matters. I installed a couple of the INRAD 2.1 mhz filters (a xmas present from the better half). Using the slope tuning with RTTY, turning off the AGC and riding the RF gain as necessary makes you almost immune to "adjacent channel interference". Of course if someone is using AFSK & splattering, then .....

Questions...

The book states that the maximum output for RTTY is 100 watts. Looking at the specs for AM, I kept my output at abt 50 watts. I doubt if the extra 3 db would make much difference, but I am curious as why they would rate the max outputs differently for RTTY and AM. Is it a case of the max pwr that the 850 will put out, or the max you should ask of it so that it doesn't overheat ????

Turning the rig on this morning, I noticed the rasp back in the cw signals again - I wonder if the extended operating time this weekend triggered it. Any way, time to bite the bullet and replace TC2 (the spray clean, blow out with canned air & twirl the trimmer a dozen times kept it good since before Christmas). The operating room is prepared for the transplant. I have two donor organs - piston caps that I bought from surplus sales, and a camera ready to take pictures on the way in.

Wish me luck

I have owned both rigs for a few years now, you can see them in the pic on QRZ under my call sign.
I think both are nice rigs.I like the FT990 and I LOVE the TS850.
Doing a "A-B" comparison on weak signals, both rigs seem to be the same as far as my hearing goes. Sometimes the 990 seems a bit clearer and sometimes the 850 seems better.
That said, The 850 is SO MUCH BETTER at cutting out near by stations(QRM)with the slope tune compared to Yaesus poor atempt with their high/low digital filter.
If the seller is local, see if the seller will let you put the two rigs side by side and see what you like better.
I just sent my TS850 to AVVID for repair and when it comes back I will be selling the FT990.
Once my 990 is sold I will be looking for another TS850 or TS940.

Don't forget the 450. That is a damn nice radio too with the filters in it. I have 850/870/450. I like all of them. I am able to work about anything I want with any of them.

10109. Re: no s-meter deflection while rx (TS-850)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-10 21:03:05 UTC
From: david broger
Topic: 9957 Message: 10109

Hi Dave
I made the check. According the manual:
R1=51Ohm
R2=100Ohm
R3=150Ohm
R4=82Ohm

I measured over R1: The resistance was 50.6Ohm
I measured over R3: The resistance was 82.3Ohm (calculated: 82.2Ohm)
I measured over R2: the resistance was 69.9Ohm (calculated: 69.9Ohm)
I measured over R4: the resistance was 61.8Ohm (calculated 61.7Ohm)

In the next step I activated K1: the resistance over R1 was 0.3 Ohm. Then I activated K2 and the resistance over R3 was 0.3 Ohm too.
Ok, I think there is no fault.

AGC was on position fast. I made a short test: I measured over R1+R3 and got 132.7Ohm (calculated 133.2Ohm). This is independat of the AGC position.
I took CN1, 9, 10, 14 and 15 away. So it was possible to turn the pcb to do the measurments on the bottom side.

No, there are no numbers on the new connector, either inside or out.
I'm going with the assumption that the diagram in the manual is looking at
the back of the radio, which like Clif said, is the same as looking at the
solder side of the plug.

MIke

Well, the patient survived. The Doctor was a little worried at the end, but it all came together...

One of the pistons I had purchased would fit if I side mounted it like http://n6tr.jzap.com/vco2.jpg -
Sure a lot easier tweeking a multiturn piston to 5.03V than it is a 180 degree trim cap....

I actually pulled the assembly right out and replaced the bad cap with a ceramic variable...It was one of those things I just had to try, and it worked....!!! 73...Jordan VE6ZT

Well, the patient survived. The Doctor was a little worried at the end, but it all came together...

One of the pistons I had purchased would fit if I side mounted it like http://n6tr.jzap.com/vco2.jpg -
Sure a lot easier tweeking a multiturn piston to 5.03V than it is a 180 degree trim cap....

Villy

Good thing that I had an old fashioned soldering iron - needed a fair bit of heat to get the VCO "case" unsoldered....

It's done now - hopefully that will be the last operation that it needs..

Way to go Villy....I used a big Weller 150W pistol for quick desoldering of the ground/shield tabs, and my old Weller 25w station for the ckt bd....I might even have some pics on my digital camera..73...Jordan...

Lots of solder wick, flux & a solder sucker....

The tabs weren't that much of a problem - I think the the three pins were more of an issue...

Villy
